

## Treated problem alcohol use in Ireland

2012 figures from the National Drug Treatment Reporting System

**National Health Information Systems,  
Health Research Board, April 2014**

## Summary

This update presents figures from the National Drug Treatment Reporting System (NDTRS) on treated problem alcohol use in Ireland, for the period 2008 to 2012.

### Overview

The total number of cases treated for problem alcohol use in Ireland increased from 7,940 in 2008 to a peak of 8,604 in 2011, decreasing in 2012 to 8,336 (Table 2).

### New cases

- The total number of new cases treated for problem alcohol use increased each year except for 2012. The number of new cases treated rose by 17.9%, from 3,833 in 2008 to 4,520 in 2011, but dropping to 4,028 in 2012.
- Overall, the number of cases who returned for treatment increased (by 16.8%), from 3,606 cases in 2008 to 4,212 in 2012 (Table 2).

### Incidence and prevalence

- The incidence of treated problem alcohol use among 15–64-year-olds living in Ireland, expressed per 100,000 of the population, increased from 119.7 in 2008 to 141.2 in 2011 and subsequently decreased to 125.1 in 2012 (Figure 1).
- The prevalence of treated problem alcohol use among 15–64-year-olds living in Ireland, expressed per 100,000 of the population, increased from 248.2 in 2008 to 269.8 in 2011 and subsequently decreased to 261.5 in 2012 (Figure 1).
- Fluctuations in prevalence and incidence may be attributed to changes in patterns of problem alcohol use in the population, levels of participation and reporting to the NDTRS, or a combination of both (Figure 2).

### Geographic distribution

- The incidence of treatment for problem alcohol use by county for the period 2008 to 2012 was highest in Waterford, Donegal, Sligo, Leitrim and Wexford (with each of these counties reporting more than 224 cases per 100,000 of the 15–64-year-old population) (Figure 2).
- The incidence rates were lowest in Clare, Roscommon, Wicklow, Mayo and Meath (with each of these counties reporting less than 83 cases per 100,000) (Figure 2).
- As in previous years, the largest proportion (39.9%) of treated alcohol cases in 2012 lived in the HSE South region, and almost one-quarter (24.1%) lived in the HSE Dublin Mid-Leinster region (Table 4).

### Poly drug use

- 18% of those treated for problem alcohol use in 2012 also reported using at least one other drug, a similar proportion to that observed in previous years (Tables 6 & 8).
- In 2012, the most common drugs used by treated alcohol cases in conjunction with alcohol were cannabis, followed by cocaine, benzodiazepines and ecstasy. This reflects a minor change since 2008, when opiates were the fourth most common additional drug. Use of more than one substance increases the complexity of cases and can lead to poorer outcomes for the patient (Tables 6 and 8).

### Socio-demographic characteristics

- In 2012, many of those in treatment for problem alcohol use started drinking alcohol at 16 years of age, with almost no change seen over the past five years (Table 9).
- The median age for cases was 40 years, similar to previous years (Table 10).
- While the proportion of cases under the age of 18 remained small (3.4%) in 2012, the number of new cases in that age group has fallen, from 6.4% in 2010 to 5.4% in 2012 (Table 10).
- The majority of cases, both new (63.3%) and previously treated (65.9%) were male.
- The proportion of cases in employment decreased from 30.3% in 2008 to 19.7% in 2012 (Table 10).

- The proportion of all cases who were homeless was highest in 2011 at 5.6% and fell slightly in 2012 to 4.7%. Previously treated cases were more likely to be homeless (6.6%) compared to new cases (2.7%) (Table 10).
- Those who used other drugs along with alcohol were more likely to be unemployed and to live in unstable accommodation (Table 10; Figures 6 and 7).

## Glossary of terms

**The median** is the value at the mid-point in a sequence of numerical values ranged in ascending or descending order. It is defined as the value above or below which half of the values lie. Unlike the mean (average), the median is not influenced by extreme values (or outliers). For example, in the case of five drug users aged 22, 23, 24, 24 and 46 years respectively, the median (middle value) is 24 years, whereas the mean is 27.8 years. While both the median and the mean describe the central value of the data, in this example, the median is more useful since the mean is influenced by the one older person in this example.

**Incidence** is a term used to describe the number of new cases of disease or events that develop among a population during a specified time interval. For example, in 2007, 10 opiate users living in a specific county sought treatment for the first time. The incidence is the number of new opiate cases treated divided by the population living in the county (say 31,182 persons in this example) expressed per given number of the population, i.e., per 100, per 1,000, per 10,000, per 100,000 etc. The calculation in this case is as follows:  $(10/31,182) \times 100,000$ , which gives an incidence rate of 32 per 100,000 of the specific county population in 2007.

**Prevalence** is a term used to describe the proportion of people in a population who have a disease or condition at a specific point or period in time. For example, in 2007, 10 opiate users living in a specific county sought treatment for the first time, 20 opiate users returned to treatment in the year and five opiate users continued in treatment from the previous year; in total there are 35 people treated for problem opiate use in 2007. The prevalence is the total number of cases (35) divided by the population living in the county (31,182 persons) expressed per given number of the population, i.e., per 100, per 1,000, per 10,000, per 100,000 etc. The calculation in this case is as follows:  $(35/31,182) \times 100,000$ , which gives a prevalence rate of 112 per 100,000 of the specific county population in 2007.

**All cases treated** describes all of the individuals who receive treatment for problem alcohol use (as a main problem substance) at each treatment centre in a calendar year. All cases treated include:

- **New cases treated** describes individuals who have never been treated for problem alcohol use (as a main problem substance); and
- **Previously treated cases** describes individuals who were treated previously for problem alcohol use (as a main problem substance) at any treatment centre and have returned to treatment in the reporting year; and
- **Status unknown** describes individuals whose status with respect to previous treatment for problem alcohol use (as a main problem substance) is not known.

## Introduction

According to the World Health Organization, alcohol is the third leading risk factor contributing to the global burden of disease. The impact of alcohol consumption on disease and injury is largely determined by the total volume of alcohol consumed and the pattern of drinking.<sup>1</sup> Ireland has one of the highest levels of alcohol consumption per capita in Europe. In 2010, 11.9 litres of pure alcohol were consumed in this country for every adult aged 15 years or over, according to figures from the Revenue Commissioners and the CSO. Alcohol is associated with a range of chronic and acute medical conditions, including liver cirrhosis, various cancers, road traffic collisions and suicide. Problem alcohol use is pervasive in Irish society, with men and women, the old and the young, experiencing its negative effects.<sup>2, 3</sup>

The National Drug Treatment Reporting System (NDTRS) is an epidemiological database on treated problem drug and alcohol use in Ireland. It is co-ordinated by the National Health Information Systems staff of the Health Research Board (HRB) on behalf of the Department of Health.

Alcohol and other drug treatment data are viewed as an indirect indicator of problem drug and alcohol use, as well as a direct indicator of demand for treatment services. NDTRS data are used at national level (alcohol and drug data) and at European level (drug data) to provide information on the characteristics of clients entering treatment and on patterns of problem substance use, such as types of substance used and consumption behaviours. Drug data are 'valuable from a public health perspective to assess needs, ... and to plan and evaluate services'.<sup>4</sup>

## Background and Methods

The NDTRS was established in 1990 in the Greater Dublin Area and was extended in 1995 to cover all areas of the country. It was developed in line with the Pompidou Group's Definitive Protocol<sup>5</sup> and subsequently refined in accordance with the Treatment Demand Indicator Protocol.<sup>6</sup> Originally designed to record problem drug use, the NDTRS recorded problematic use of alcohol only in cases where it was an additional problem substance, that is, where the client's main reason for entering treatment was problem drug use but he/she also reported problematic use of alcohol. In 2004, the remit of the NDTRS was extended to include cases where alcohol was recorded as the main or only reason for seeking treatment.

The monitoring role of the NDTRS was recognised by the government in its document *Building on experience: National Drugs Strategy 2001–2008*.<sup>7</sup> The collection and reporting of data to the NDTRS was one of the actions identified and agreed by government for implementation. The *National Drugs Strategy (interim) 2009–2016*<sup>8</sup> (NDS) recognised the positive impact of the NDTRS on the development of key indicators, stating that '...the information provided through the NDTRS provide[s] significant insights into the patterns of problem drug use', and that 'drug treatment data have also improved substantially through the NDTRS...' (p. 69). The NDS also recommends the continuation and further development of data-collection systems, including the NDTRS (Action 49).

The HRB supplies service providers and policy makers with relevant data from the NDTRS to inform local and national substance misuse policy and planning. In recent years this information has been central to drug strategy and policy decisions:

- In 1996 NDTRS data were used to identify a number of local areas with problematic heroin use.<sup>9</sup> These areas were later designated as local drugs task force (LDTF) areas, and task force teams have continued to provide strategic responses to problem drug use in their communities.
- In 2004 NDTRS data were used to describe treatment-seeking characteristics and behaviours of those aged under 18 years and to inform the deliberations of the Working Group on treatment of under-18-year-olds.<sup>10</sup>

- In 2007 NDTRS data were used to inform some of the recommendations of the Working Group on drugs rehabilitation, and to assist the Working Group on residential services in estimating the number of residential places required to address severe alcohol and drug problems in Ireland.<sup>11</sup>
- In 2009 the Comptroller and Auditor General used data from the NDTRS in a special report on treatment and rehabilitation services provided for people with drug addictions.<sup>12</sup>
- In 2009 the NDS steering group used NDTRS data extensively to assess progress under the previous strategy.<sup>8</sup>

Compliance with the NDTRS requires that one form be completed for each new client coming for their first treatment and for each previously treated client returning to treatment for problem substance use. Service providers at treatment centres throughout Ireland collect data on episodes of treatment, rather than on the individual person treated each year. HRB staff compile anonymous, aggregated data, which are analysed and reported at national and EU levels.

The main elements of the reporting system in the context of this paper are defined as follows:

*All cases treated* – individuals who receive treatment for alcohol as a **main problem substance** at each treatment centre in a calendar year, including:

*New cases treated* – individuals who have never been treated for problem alcohol use;

*Previously treated cases* – individuals who were previously treated for problem alcohol use at any treatment centre at any time in the past and have returned to treatment in the reporting year; and

*Status unknown* – individuals whose status with respect to previous treatment for problem alcohol use is not known.

For the purpose of the NDTRS, treatment is broadly defined as any activity which aims to ameliorate the psychological, medical or social state of individuals who seek help for their problem substance use problems. Clients who attend needle-exchange services are not included in this reporting system. Treatment options for problem alcohol use include one or more of the following: medication, psychiatric treatment, brief intervention, counselling (including cognitive behavioural therapy), medication-free therapy, family therapy, complementary therapy, and/or life-skills training.

Treatment for problem use of alcohol in Ireland is provided by statutory and non-statutory services, including general hospitals, psychiatric hospitals, community-based services and residential centres. Most treatment of problem alcohol use takes place in outpatient facilities; more complex treatments are carried out in residential settings.<sup>2</sup> The 233 treatment services that returned alcohol treatment data to the HRB in 2012 included 141 non-residential centres and 37 residential centres and 55 low threshold services.

### **Interpretation of data**

Three factors must be taken into consideration when interpreting the figures in this paper.

1. Despite an increase from 191 in 2008 to 233 in 2012 in the number of alcohol treatment services reporting to the NDTRS, not all services participate in the system. In particular, the coverage for cases reporting alcohol as their main problem substance is incomplete in the west (Galway, Mayo and Roscommon). Up to 2007, the alcohol services managed by the mental health services had never been invited to take part in the reporting system. The process of recruiting services that have not participated in the NDTRS to date is ongoing.
2. Each record in the NDTRS database relates to a treatment episode (a case), and not to a person. This means that the same person could be counted more than once in the reporting year if they had more than one treatment episode in that year.
3. The place of residence of almost two per cent of cases for the years 2008–2012 was not recorded, and an additional small number of cases lived outside Ireland. These cases could

not be assigned to a specified HSE region or county. The data presented in Tables 1–3 and Figures 1-2 in this paper are based on the total of 40,562 treated cases. The remainder of the tables and figures are based on the 39,654 treated cases who lived at a known address in Ireland.

## Outline of document

The tables presented examine:

- service provision
- number of cases treated
- incidence and prevalence of treated alcohol use
- area of residence
- additional problem substances
- treatment provision
- age at which alcohol and other drug use started
- socio-demographic characteristics of treated cases.

### Service provision

**Table 1 Number and type of services providing treatment for problem alcohol use and number of cases treated (in brackets) (NDTRS 2008–2012)**

Services	2008	2009	2010	2011	2012
<b>All services (cases treated)</b>	191 (7940)	206 (7816)	228 (7866)	233 (8604)	233 (8336)
Outpatient (cases treated)	149 (4396)	140 (4446)	146 (4179)	145 (4635)	141 (4508)
Residential (cases treated)	37 (3481)	46 (3179)	36 (3227)	34 (3378)	37 (3309)
Low-threshold* (cases treated)	5 (63)	20 (191)	46 (460)	54 (591)	55 (519)

\*Low-threshold services provide low-dose methadone or drop-in facilities only.

### Number of cases treated

**Table 2 Number (%) of cases treated, by treatment status (NDTRS 2008–2012)**

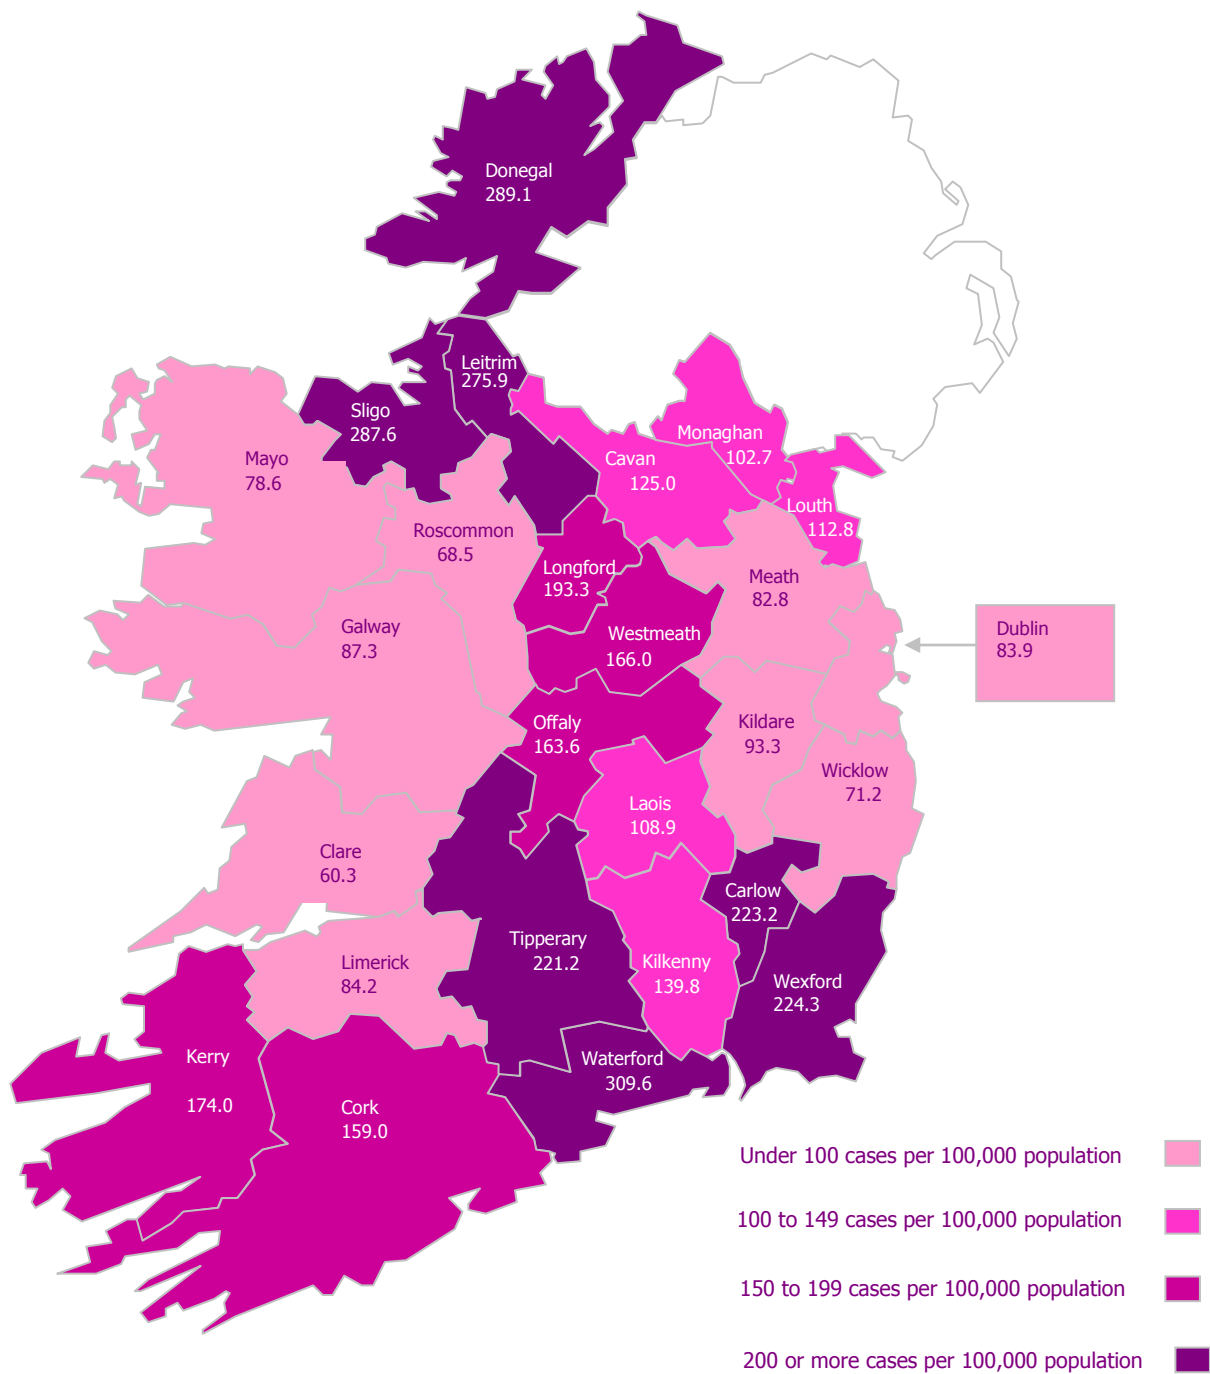

Treatment status	2008	2009	2010	2011	2012
	<b>Number (%)</b>				
<b>All cases</b>	7940	7816	7866	8604	8336
New cases	3833 (48.3)	4220 (54.0)	4178 (53.1)	4520 (52.5)	4028 (48.3)
Previously treated cases	3606 (45.4)	3524 (45.1)	3583 (45.6)	3971 (46.2)	4212 (50.5)
Treatment status unknown	501 (6.3)	72 (0.9)	105 (1.3)	113 (1.3)	96 (1.2)

### Incidence and prevalence of treated alcohol use

In order to adjust for variation in population size in each county, the actual incidence of treated alcohol use in each area was calculated using the average number of new cases over the five-year period living in each of the 26 counties; this average was divided by the population aged 15 to 64 years living in the respective counties, using the Census of Population figures for 2011<sup>13</sup> and population estimates published by the CSO (2013).<sup>14</sup>

**Figure 1 Incidence and prevalence of treated problem alcohol use, per 100,000 of the 15–64-year-old population (NDTRS 2008–2012; CSO 2012, 2013)**

**Figure 2 Average annual incidence of treated problem alcohol use, by county of residence, per 100,000 of the 15–64-year-old population (NDTRS 2008–2012; CSO 2011, 2013)**

**Table 3 Number (%) of cases treated, by place of residence (NDTRS 2008–2012)**

<b>Place of residence</b>	<b>2008</b>	<b>2009</b>	<b>2010</b>	<b>2011</b>	<b>2012</b>
	<b>Number (%)</b>				
<b>All cases</b>	7940	7816	7866	8604	8336
Specified HSE region	7641 (96.2)	7666 (98.1)	7745 (98.5)	8452 (98.2)	8150 (97.8)
Ireland, address not recorded	257 (3.2)	119 (1.5)	86 (1.1)	103 (1.2)	117 (1.4)
Outside Ireland	54 (0.7)	31 (0.4)	35 (0.4)	49 (0.6)	69 (0.8)

**The tables and figures presented from this point on exclude cases whose HSE region of residence is not known, and cases who are not normally resident in Ireland.**

**Table 4 Number (%) of cases treated, by HSE region of residence and by treatment status (NDTRS 2008–2012)**

HSE region of residence	2008	2009	2010	2011	2012
	Number (%)				
<b>All cases</b>	<b>7641</b>	<b>7666</b>	<b>7745</b>	<b>8452</b>	<b>8150</b>
Dublin North East	1232 (16.1)	1234 (16.1)	1020 (13.2)	1164 (13.8)	1206 (14.8)
Dublin Mid–Leinster	1792 (23.5)	1744 (22.7)	1691 (21.8)	1940 (23.0)	1967 (24.1)
South	2456 (32.1)	2793 (36.4)	3052 (39.4)	3507 (41.5)	3250 (39.9)
West	2161 (28.3)	1895 (24.7)	1982 (25.6)	1841 (21.8)	1727 (21.2)

\* By cases reporting use of one, two or three additional substances.

<sup>†</sup> The percentages shown are the proportions of all problem alcohol users who used each additional problem substance.

**Figure 3 Additional problem substances associated with alcohol as a main problem substance among new cases (NDTRS 2008–2012)**

### Treatment provision

It is well recognised that there is no single treatment method to address alcohol problems. In practice, there are a number of effective treatments that may be provided in various treatment settings and which meet the needs of different types of problem alcohol user. Those whose problems are more complex due to severe dependence, psychological morbidity or social disorganisation are likely to need more intensive treatments.<sup>15</sup> A broad range of services covering treatment and rehabilitation is provided throughout the country. The NDTRS records the treatment intervention(s) provided when the client is first admitted to a treatment service.

**Figure 4 Percentage of cases, by the number of initial treatment interventions availed of (NDTRS 2012)**

**Figure 5 Percentage of cases, by type of initial treatment provided (NDTRS 2012)**

## Age at which alcohol and other drug use started

**Table 9 Age at which substance use started, by treatment status (NDTRS 2008–2012)**

	2008	2009	2010	2011	2012
<b>All cases</b>					
<b>Number of responses for age first used any drug (excluding alcohol)</b>	1889	2025	2235	2678	2476

## Acknowledgements

Anne Marie Carew is the author of this paper.

The author would like to express sincere thanks to all those who contribute to the work of the NDTRS, in particular, Lorraine Caprani, Ita Condron, Vivion McGuire, and Suzi Lyons.

Without the ongoing support of staff at alcohol and drug treatment services throughout the country it would not be possible to maintain the NDTRS. Their co-operation is very much appreciated and valued.
