# About the HRB

The Health Research Board (HRB) is the lead agency supporting and funding health research in Ireland. We also have a core role in maintaining health information systems and conducting research linked to these systems. Our aim is to improve people's health, build health research capacity, underpin developments in service delivery and make a significant contribution to Ireland's knowledge economy.

## Our information systems

The HRB is responsible for managing five national information systems. These systems ensure that valid and reliable data are available for analysis, dissemination and service planning. Data from these systems are used to inform policy and practice in the areas of alcohol and drug use, disability and mental health.

The **HRB Statistics Series** compiles data on problem alcohol and drug use, disability and mental health from a single point or period in time. Previous reports associated with this series are:

- Activities of Irish Psychiatric Units and Hospitals (1965–2005)
- National Physical and Sensory Disability Database Committee Annual Reports (2004–2006)
- National Intellectual Disability Database Committee Annual Reports (1996–2006)

The **Mental Health Information Systems** (MHIS) unit gathers data on patient admissions and discharges from psychiatric hospitals and units throughout Ireland. The data collected have been reported in the Activities of Irish Psychiatric Services since 1965 and continue to play a central role in the planning of service delivery. These findings inform national policy, health service management, clinical practice and international academic research in the area of mental health.

# Acknowledgements

The MHIS unit would like to thank all our contacts in units and hospitals for submitting the information for this report and for their continuing commitment and dedication. We would also like to thank our colleagues Yvonne Dunne and Deirdre Hallissey for collecting and collating the information that is central to the report and to Rosalyn Moran, Head of Unit. We would also like to thank the Mental Health Specialists for their on-going support of the NPIRS database.

The following is the list of NPIRS contacts to whom we extend our thanks.

## **HSE Dublin Mid-Leinster:**

# Glossary

*Central Mental Hospital.* The Central Mental Hospital, Dundrum, is administered by HSE Dublin Mid-Leinster but serves the country as a whole rather than a specified catchment area.

*Health Research Board (HRB).* The Health Research Board was established in 1986 (under Statutory Instrument No. 279) to promote, assist, commission and conduct medical, health, epidemiological and health services research in Ireland. The board arose from the amalgamation of two former bodies, the Medical Research Council and the Medico-Social Research Board (MSRB).

*Health Service Executive (HSE) Area.* The address from which each patient was admitted to hospital was used to allocate the patient to the corresponding Health Service Executive area and the admission was rated accordingly. Thus, tabulations relating to HSE areas were calculated irrespective of whether or not the patient was admitted to a hospital administered by that area. Data on patients admitted to independent/private and private charitable centres were returned to the area in which they normally resided. A map outlining each HSE area and its respective catchment population according to the Census of Population 2011 (Central Statistics Office, [www.cso.ie](http://www.cso.ie)) is presented in Chapter 1.

*Hospital In-Patient Enquiry scheme (HIPE).* HIPE is a computer-based system designed to collect demographic, clinical and administrative data on discharges and deaths from acute hospitals nationally. It was started on a pilot basis in 1969 and then expanded and developed as a national database of coded discharge summaries from the 1970s onwards. In 1990, the management of the HIPE Scheme was transferred from the Health Research Board to the ESRI. The ESRI, in association with the Health Service Executive, manage this national database.

*ICD-10.* The diagnostic groups in this report are based on the World Health Organization's (WHO) International Classification of Diseases categories (ICD-10) (WHO 1992).

*In-patient days.* In-patient days were the number of days spent in hospital from date of admission to date of discharge. It was calculated by subtracting date of admission from date of discharge, including time spent on transfer for medical or surgical purposes while still 'on the books' of psychiatric units and hospitals.

*Legal status.* The legal status reported throughout this report is that recorded on admission. Changes may occur in legal status following admission but this is not recorded by the NPIRS.

*Length of stay.* Length of stay is derived by calculating the amount of time spent in hospital between admission and discharge by subtracting date of admission from date of discharge, including time spent on transfer for medical or surgical purposes while still 'on the books' of psychiatric units and hospitals. It should be remembered that because of existing legislative provisions, a small number of involuntary patients may be discharged on trial but remain 'on the books' until formally discharged later.

*Independent/private and private charitable centres.* This term replaces the previously used term 'private hospitals'.

*Socio-economic group.* Patients were allocated to one of 11 socio-economic groups (SEGs) according to the Classification of Occupations of the Central Statistics Office (CSO) in the Census of Population 2011 (Central Statistics Office, [www.cso.ie](http://www.cso.ie)). Socio-economic group is determined by a person's occupation or their former occupation where the patient was unemployed or retired. If a patient was a student or engaged in house duties, the occupation of the head of household or spouse or guardian is used to determine socio-economic group. If such persons (students and/or persons engaged in house duties) are not members of a family unit and/or are living alone (e.g. widowed grandparents), they are assigned to the unknown group.

# Executive summary

## National admissions

There were 18,173 admissions to Irish psychiatric units and hospitals in 2012, a rate of 396.1 per 100,000 total population. This is a reduction of 819 admissions from 2011 and a decline in rates from 413.9 in 2011 to 396.1 in 2012. First admissions remained unchanged, at 6,129 in 2011 and 6,130 in 2012, with the rate similarly remaining unchanged, at 133.6 per 100,000. There was a decline in re-admissions (by 820) from 12,863 in 2011 to 12,043 in 2012, while the proportion of admissions that were re-admissions also declined from 68% in 2011 to 66% in 2012.

Despite the equal proportion of male and female admissions, males had a slightly higher rate of all admissions, at 401.0 per 100,000, than females, at 391.2. Similarly, males had a higher rate of first admissions, at 142.6 per 100,000, compared with 124.7 for females. The 45–54 year age group had the highest rate of all admissions, at 612.7 per 100,000, followed by the 55–64 year age group, at 562.3, and the 35–44 year age group, at 547.7. The 18–19 year age group had the highest rate of first admissions, at 233.5 per 100,000, followed by the 20–24 year age group, at 221.0, and the 45–54 year age group, at 181.0.

Single persons accounted for over half (55%) of all admissions, married persons accounted for 27%, widowed accounted for 4% and divorced accounted for 4%. Although divorced persons accounted for just 4% of all admissions, they had the highest rate of all and first admissions, with rates of 749.7 per 100,000 for all and 189.1 for first admissions. Married persons had the lowest rate of all admissions, at 284.6, and first admissions, at 111.1. As in previous years, the unskilled occupational group had the highest rate of all (856.2) and first admissions (219.2). However, it must be noted that 46% of occupations were returned as unknown or unspecified, thus making assignment to a socio-economic group impossible.

Forty per cent of all admissions in 2012 were returned as unemployed, 25% as employed, 11% as retired, 7% as students, and a further 7% as engaged in house duties. Ten per cent were returned as unknown. Eighty-four per cent of all admissions were returned as 'White Irish', 5% (5.3%) were returned as 'Any Other White Background' and 3% (2.9%) were distributed amongst various other ethnic groups. Eight per cent were returned as 'Unknown/unspecified'.

Depressive disorders were the most common diagnoses returned for admissions in 2012, accounting for 30% of all, 32% of first and 28% of re-admissions, and accounting for the highest rate of all (117.4) and first admissions (43.2). Schizophrenia accounted

for 20.5% of all, 13% of first and 24.5% of re-admissions and had the second-highest rate of all (81.1) and first (16.8) admissions. Neuroses also had a rate of 16.8 per 100,000 for first admissions.

Eleven per cent (10.6%) of all and 11% (10.9%) of first admissions in 2012 were involuntary, a slight increase from almost 10% (9.5%) of all and almost 11% (10.5%) of first admissions in 2011. There was a slight increase in the rate of involuntary all admissions from 39.4 per 100,000 in 2011 to 41.9 in 2012. The rate of involuntary first admissions remained relatively unchanged, at 14.5 per 100,000 (14.0 in 2011). Admissions for schizophrenia had the highest rate of involuntary all admissions, at 18.0 per 100,000, followed by mania, at 8.1, and depressive disorders, at 4.9.

There were 174 admissions with no fixed abode in 2012; 71% were male, 76% were single, 28% had a diagnosis of schizophrenia, 18% had a diagnosis of other drug disorders and 14% had a diagnosis of depressive disorders.

## **National discharges and deaths**

There were 17,986 discharges from, and 153 deaths in, Irish psychiatric units and hospitals in 2012. This is a decline in the number of discharges by 982 and an increase in the number of deaths by 35 from 2011. Males accounted for 60% of all deaths, and 82% of those who died were aged 65 years and over.

Ninety-two per cent of all those admitted in 2012 and 93% of first admissions in 2012 were discharged in 2012.

Almost one-third of all discharges occurred within one week of admission, 18% occurred within one to two weeks of admission, 20% occurred within two to four weeks of admission and a further 26% occurred within one to three months of admission. Ninety-four per cent were discharged within three months of admission. Over 90% of discharges for most disorders occurred within three months of admission, with the exception of organic mental disorders (73%), schizophrenia (88%), intellectual disability (77%) and development disorders (88%).

The average length of stay for all discharges was 92.4 days (median 14 days), while the average length of stay for discharges up to one year was 25.5 days (median 14 days). Discharges (excluding those with a length of stay of one year or more) with a diagnosis of organic mental disorders had the longest average length of stay, at 51.9 days (median 26 days), while other drug disorders had the shortest average length of stay, at 13 days (median 6 days).

## HSE Areas

Twenty-eight per cent of all admissions in 2012 were resident in Dublin Mid-Leinster, 25% were resident in HSE South, almost 25% (24.5%) were resident in HSE West and 22% were resident in Dublin North-East. Less than one per cent of all admissions were returned as non-resident at the time of admission. Admissions resident in HSE West had the highest rate of all admissions, at 411.3 per 100,000, followed by HSE South, at 407.9, and Dublin North-East, at 387.2. Dublin Mid-Leinster had the lowest rate of all admissions, at 376.6 per 100,000.

The proportion of re-admissions ranged from 69% for admissions resident in HSE West to 64% for admissions resident in Dublin North-East. HSE West had the highest rate of re-admissions, at 285.6 per 100,000, followed by HSE South, at 266.0, Dublin Mid-Leinster, at 251.3, and Dublin North-East, at 246.7.

Females had higher rates of all admissions in Dublin Mid-Leinster, at 382.1, and Dublin North-East, at 397.9, compared with 370.9 for males in Dublin Mid-Leinster and 376.2 in Dublin North-East. In contrast, males had higher rates in HSE South and West, at 413.9 and 443.3 respectively, compared with 402.0 for females in HSE South and 379.4 in HSE West. Males had higher rates of first admissions in all HSE areas, with rates ranging from 151.1 in HSE Dublin North-East to 130.3 in Dublin Mid-Leinster.

All admission rates for the 45–54 year age group were highest amongst three of the four HSE areas: Dublin Mid-Leinster, at 612.4 per 100,000, Dublin North-East, at 617.5, and HSE South, at 619.0. The 20–24 year age group had the highest rate of admission amongst those resident in HSE West. When age groups were condensed into two groups – under 45 year and 45 years and over – the 45 years and over group had the highest rate of admissions in all HSE areas, with rates ranging from 581.6 in Dublin Mid-Leinster to 516.3 in HSE South.

Depressive disorders had the highest rate of all and first admissions across all four HSE areas in 2012. Rates for all admissions ranged from 132.9 per 100,000 in HSE West to 103.9 in Dublin North-East, while rates for first admissions ranged from 49.3 per 100,000 in HSE South to 37.7 in Dublin Mid-Leinster.

Eleven per cent of all admissions resident in HSE West and 11% of those resident in Dublin North-East were involuntary, while 10% in HSE South and 10% in Dublin Mid-Leinster were involuntary. Thirteen per cent of first admissions in Dublin North-East were involuntary, compared with 10% in each of the three remaining HSE areas. The highest rate of involuntary all admissions was returned for residents in HSE West, at 44.9, followed by HSE South, at 42.8, Dublin North-East, at 42.3, and Dublin Mid-Leinster, at 36.8.

Almost one-third of all discharges in three of the four HSE areas in 2012 occurred within one week of admission: 31.5% in Dublin North-East, 31% in HSE South and 31% in HSE West. Twenty-eight per cent of discharges for Dublin Mid-Leinster occurred within one week of admission. Seventy-two per cent of discharges for HSE West, 69% for HSE South, 68% for Dublin North-East and 64% for Dublin Mid-Leinster occurred within four weeks of admission, while over 92% in all areas occurred within three months of admission.

Average length of stay was longest for HSE South, at 131.4 days (median 14 days), when all discharges were examined, followed by Dublin North-East, at 107.6 days (median 13 days), and HSE West, at 81.1 days (median 13 days). Average length of stay was shortest for Dublin Mid-Leinster, at 54.9 days (median 16 days). When discharges of one year or more were excluded to adjust for the distortion of in-patient days caused by the small number of discharges with considerably long lengths of stay, average length of stay was longest for Dublin Mid-Leinster, at 27.5 days (median 16 days), followed by Dublin North-East, at 25.8 days (median 13 days), and HSE South, at 25.2 days (median 13 days). Length of stay was shortest in HSE West, at 23.1 days (median 13 days).

## Counties

The highest rates of all admissions for 2012 were reported for counties Sligo (544.4), Roscommon (541.6), Kerry (528.5) and Tipperary South (490.8). Monaghan had the lowest rate of all admissions, at 157.1. Roscommon had the highest rate of first admissions, at 187.3, followed by Kerry, at 175.3, Wexford, at 167.2, and Carlow, at 153.8. Monaghan had the lowest rate of first admissions, at 44.6.

## Non-residents

There were 54 admissions for non-residents in 2012, an increase of five such admissions from 2011. Thirty-nine per cent of non-residents had an address originating in Northern Ireland, 24% had an address originating in England, 13% in the USA, 7% in Germany and 4% in Denmark, with the remaining admissions distributed amongst other countries. Almost 32% (31.5%) had a primary admission diagnosis of schizophrenia, 26% had a diagnosis of mania, 11% had a diagnosis of personality and behavioural disorders and 9% had a diagnosis of depressive disorders.

## Hospital type

Almost 57% (56.5%) of all admissions in 2012 were to general hospital psychiatric units, 22% were to psychiatric hospitals (including the Central Mental Hospital Dundrum; Carraig Mór, Cork; and St Joseph's Intellectual Disability Services, St Ita's Hospital, Portrane) and 22% were to independent/private and private charitable centres. Re-admissions accounted for 70% of all admissions to psychiatric hospitals, 66% of all admissions to general hospital psychiatric units and almost 63% (62.5%) of all admissions to independent/private and private charitable centres.

Males accounted for over half of all (53%) and first (56%) admissions to general hospital psychiatric units and psychiatric hospitals (54% of all and 57% of first), while females accounted for almost 61% of all (60.5%) and 58% of first admissions to independent/private and private charitable centres. The age profile of admissions to independent/private and private charitable centres was somewhat older than that to general hospital psychiatric units or psychiatric hospitals, with almost 61% (60.5%) of all admissions to independent/private and private charitable centres over 45 years of age, compared with less than half of admissions to general hospital psychiatric units (43%) and psychiatric hospitals (46%).

Over one-third of all (36%) and first (35%) admissions to independent/private and private charitable centres had a primary admission diagnosis of depressive disorders, compared with 29.5% of all and 32% of first admissions to general hospital psychiatric units, and 23.5% of all and 29% of first admissions to psychiatric hospitals. Schizophrenia accounted for a considerably lower proportion of all (8%) and first (4%) admissions to independent/private and private charitable centres, compared with general hospital psychiatric units, at 23% of all and 14% of first, and psychiatric hospitals, at 27% of all and 19% of first admissions.

Involuntary admissions accounted for 16% of all admissions to psychiatric hospitals, 12% of all admissions to general hospital psychiatric units and just 2% of all admissions to independent/private and private charitable centres. There was an increase in the

proportion of involuntary admissions to both psychiatric hospitals (13% in 2011) and general hospital psychiatric units (11% in 2011) from 2011 to 2012. Nineteen per cent of first admissions to psychiatric hospitals, 12% of admissions to general hospital psychiatric units and just 2% of first admissions to independent/private and private charitable centres were involuntary.

Over one-third of all discharges from both general hospital psychiatric units (36%) and psychiatric hospitals (34%) occurred within one week of admission, compared with 11% from independent/private and private charitable centres. Over half of all discharges from general hospital psychiatric units (56%) and from psychiatric hospitals (54%) occurred within two weeks of admission, compared with 23% from independent/private and private charitable centres.

Average length of stay for all discharges was longest in psychiatric hospitals, at 309.2 days (median 12 days), followed by 47.2 days (median 31 days) in independent/private and private charitable centres and 24.2 days (median 11 days) in general hospital psychiatric units. When discharges of one year or more were excluded, independent/private and private charitable centres had the longest average length of stay, at 36.3 days (median 31 days), followed by psychiatric hospitals, at 25.6 days (median 11 days), and general hospital psychiatric units, at 21.3 days (median 11 days).

## **Child and adolescent admissions**

There were 397 admissions for under 18s in 2012, a reduction of 38 admissions since 2011. There were 299 first admissions for under 18s, accounting for 75% of all admissions. Of all admissions for under 18s, 288 were to dedicated child and adolescent in-patient services.

Females accounted for 60% of all and 61% of first admissions for under 18s in 2012. Almost 38% of all admissions for under 18s were aged 17 years on admission, 25% were aged 16 years, 19% were aged 15 years, 9% were aged 14 years, 6% were aged 13 years and 2.5% were 12 years or younger.

Thirty-five per cent of all admissions for under 18s had a primary admission diagnosis of depressive disorders, 13% had a diagnosis of neuroses, 12% had a diagnosis of schizophrenia and 10% had a diagnosis of eating disorders. Females accounted for almost 71% (70.5%) of all admissions for under 18s with a primary admission diagnosis of depressive disorders, 52% of all admissions for mania and 85% of all admissions for eating disorders. In contrast, males accounted for 57% of all admissions with a primary admission diagnosis of schizophrenia and 58% of admissions with neuroses.

Almost 5% (4.5%) of all admissions for under 18s in 2012 were involuntary and 4% of first admissions were involuntary. Twenty-eight per cent of all involuntary admissions had a primary diagnosis of depressive disorders, 22% had a diagnosis of schizophrenia and 17% each had a diagnosis of mania and other drug disorders.

Almost three-quarters (72.5%) of all admissions for under 18s in 2012 were to dedicated child and adolescent units, 21% were to general hospital psychiatric units and 6% were to psychiatric hospitals. There were no admissions for under 18s to independent/private and private charitable centres. Almost identical proportions were observed for first admissions.

Eighty-five per cent of all under 18s admitted in 2012 were also discharged in 2012. Of these, 28% were discharged within one week, 11% were discharged within one to two weeks, 15% were discharged within two to four weeks, 36% were discharged within one to three months and 10% were discharged within three months to one year of admission.

The average length of stay for under 18s admitted and discharged in 2012 was 38 days (median 22 days). The average length of stay was longest for child and adolescent units, at 52.1 days (median 42 days), followed by psychiatric hospitals, at 11.5 days (median 6.5 days), and general hospital psychiatric units, at 7 days (median 4 days).

## Ten-year review

There has been a 21% decline in admissions in the ten-year period from 2003–2012, from 23,031 in 2003 to 18,173 in 2012. There was a greater level of decline for re-admissions during this period, at 26.5%, from 16,375 in 2003 to 12,043 in 2012. While the number of first admissions overall has not changed greatly over the last 40 years or so, there has been a decline of 8% in the ten-year period 2003–2012. The proportion of involuntary admissions has remained unchanged from 2003–2012, at 11%, although that for first admissions decreased from 13% in 2003 to almost 11% (10.5%) in 2012. In the ten-year period from 2003–2012, admissions to general hospital psychiatric units increased from 44% in 2003 to almost 57% in 2012, while admissions to the older psychiatric hospitals have decreased, from 38% in 2003 to 22% in 2012, in accordance with policy. Admissions to independent/private and private charitable centres increased from 18% in 2003 to 22% in 2012.

# 1 Introduction and Background Information

We are pleased to present our annual report on the activities of Irish psychiatric in-patient services for the year 2012. This is the 42nd consecutive year for which data has been returned to the National Psychiatric Inpatient Reporting System (NPIRS) and presented for publication. We pay tribute to all our NPIRS contacts in approved centres throughout the country without whose cooperation and commitment none of this would be possible. The annual reports produced from the database continue to play a key role in the planning of service delivery. National and regional bulletins capturing data for the HSE areas, along with an in-patient census carried out every three years, are also produced from the database. The database also provides much of the data on Performance Indicators (PIs) for the mental health services which are used to monitor targets in certain key areas of the services.

The health information strategy document *Health Information – A National Strategy* (Department of Health and Children 2004) emphasised the need for service planning and implementation to be based on high-quality, reliable and timely information. The NPIRS database continues to fulfil this need by producing high-quality, reliable and timely data every quarter and annually. Moreover, the HRB Strategic Business Plan 2010–2014 committed to carrying out an evaluation of NPIRS to ensure that the information system was of high quality and fit-for-purpose. A random sample of 1,123 admissions in 2010 from the NPIRS database was compared with hospital sources for the same records across 13 data fields. The audit identified matches, discrepancies and incomplete data. The overall results of the evaluation were extremely positive with an overall accuracy rate of 97.8%, which is high by international standards. Similarly, completeness rates were exceptionally high, at 99%. The personal relationship between the NPIRS team in the HRB and the NPIRS contact people in each approved centre was the single most important factor in producing complete and accurate data and this is something that the NPIRS team values highly. The full report is available for download at [http://www.hrb.ie/uploads/media/Evaluation\\_of\\_the\\_HRB\\_NPIRS.pdf](http://www.hrb.ie/uploads/media/Evaluation_of_the_HRB_NPIRS.pdf).

The Mental Health Information Systems (MHIS) Unit liaises closely with all its stakeholders involved in the collection of mental health information. The unit continuously strives to review and update the database and the variables collected in terms of their relevance to the mental health services. The NPIRS data standards are reviewed annually along with the NPIRS training manual. Training and visits to approved centres continued in 2012, with further training and visits planned in 2013.

In addition, the MHIS continues to work closely with the Mental Health Commission (MHC). A Memorandum of Understanding (MOU) was signed by the HRB and the MHC in 2008, allowing for cooperation in areas of mutual interest regarding mental health information and for close liaison between the two agencies in an effort to avoid, where possible, areas of duplication in the collection of mental health information. As part of the MOU, the HRB agreed to collect data for NPIRS from all centres approved under the Mental Health Act 2001. As new centres become approved, they are contacted by the MHIS to request submission of activity data to the NPIRS. Another key facet of the MOU was the agreement by the HRB to undertake a psychiatric in-patient census every three years, commencing in 2010. The results of the 2010 census are available in the report *Irish Psychiatric Units and Hospitals Census 2010* (Daly and Walsh 2011). The MHIS Unit carried out another in-patient census in March 2013 and the results will be available shortly.

Data in this report were obtained from the National Psychiatric In-Patient Reporting System (NPIRS). On the advice of the *Commission of Enquiry on Mental Illness* (Department of Health 1966), the Department of Health carried out a census of patients resident in Irish psychiatric hospitals on 31 March 1963, and information on all admissions, discharges and deaths thereafter was collected locally and returned to the Department. On the establishment of the Medico-Social Research Board (MSRB), the census and admission data were transferred to that organisation for analysis and publication. The MSRB published the results of the 1963 psychiatric in-patient census (Walsh 1971), along with a composite publication of data for 1965–1969 (O'Hare and Walsh 1972).

In 1971, the MSRB revised and improved this reporting from in-patient psychiatric facilities, commencing with a census on 31 March of that year. Subsequently, the MSRB, and later its successor, the Health Research Board (HRB), continued the series of annual activities reports on admissions, discharges and deaths and continued decennial censuses, the most recent of which was carried out on 31 March 2013.

This report presents cross-sectional data on admissions, discharges and deaths for psychiatric in-patient facilities in Ireland in 2012. Data are presented nationally, regionally (by HSE area), and locally (by county, by hospital type and by individual unit and hospital). Data on admissions for children and adolescents, i.e. those under 18 years of age and those admitted to in-patient child and adolescent services, are presented separately in this report in Chapter 5. Data on admissions to the dedicated child and adolescent units (CAMHS, Galway; Warrenstown House/Linn Dara Child and Adolescent Inpatient Unit, Dublin; Ginesa Unit, St John of God Hospital, Dublin; St Joseph's Adolescent Inpatient Unit; Willow Grove Adolescent Inpatient Unit; and Éist Linn Child and Adolescent In-patient Unit, Cork) are included in that chapter, along with data on admissions to units and hospitals for persons under 18.

Comparative data for 2011 used throughout the report are from the publication *Activities of Irish Psychiatric Units and Hospitals 2011: Main Findings* (Daly and Walsh 2012) and rates reported are per 100,000 total population. All tables referred to in the text are located at the end of each chapter.

More detailed analysis of the data presented in this report is available on request. A data request form including the terms and conditions concerning the use of data supplied from the NPIRS, along with an information document regarding the database, *Information for users of the NPIRS database*, can be downloaded from the HRB website [www.hrb.ie](http://www.hrb.ie). This information document outlines the variables collected and records changes in the database over the years. A privacy and confidentiality policy document entitled *Privacy and Confidentiality Policy relating to data held in the Mental Health Information Systems Unit (MHIS Unit) including procedures for the request and release of data* is also available on the HRB website ([www.hrb.ie](http://www.hrb.ie)) and it is advised that this document be consulted before requests for data are submitted to the MHIS Unit.

## Data coverage and collection

Data on admissions to, and discharges from, 67 general hospital psychiatric units, psychiatric hospitals, independent/private and private charitable centres, child and adolescent units and the Central Mental Hospital (CMH) are included in this report. A breakdown of each hospital type for 2012 is presented in Table 1.1.

**Table 1.1** Number of hospitals by hospital type

Hospital type	Number
General hospital psychiatric units	22
Psychiatric hospitals	30
Independent/private and private charitable centres	6
Child and adolescent units	6
Central Mental Hospital	1
Carraig Mór, Cork <sup>a</sup>	1
St Joseph's Intellectual Disability Service <sup>b</sup>	1
<b>Total</b>	<b>67</b>

<sup>a</sup> Carraig Mór is an intensive care and rehabilitation unit.

<sup>b</sup> St Joseph's Intellectual Disability Service is located at St Ita's Hospital – Mental Health Services, Portrane.

Hospitals and units included in this report are all those on the Register of Approved Centres under the Mental Health Act 2001. A number of new approved centres opened in 2012, while some also closed. Table 1.2 overleaf outlines the centres which opened and closed during the year.

**Table 1.2** Approved centres which opened and closed during 2012

Approved centres opened during 2012	Approved centres closed during 2012
Heywood Lodge, Clonmel 23/04/2012	Warrenstown House 31/05/2012
Linn Dara Child and Adolescent Unit 11/05/2012	St Michael's Unit, South Tipperary General Hospital 16/07/2012
St Bridget's Ward and St Marie Goretti's Ward, Cluain Lir Care Centre 31/05/2012	St Luke's Hospital, Clonmel 26/07/2012
	Curragour Ward, St Camillus' Hospital, Limerick. The centre will henceforth be known as Tearmann Ward – May 2012

A number of changes during the year should also be noted. Hampstead and Highfield Hospitals closed and are now known as Highfield Hospital. Linn Dara Child and Adolescent Unit replaced Warrenstown House and data for both are combined and reported as Warrenstown House/Linn Dara Child and Adolescent Unit. Although Curragour Ward in St Camillus' Hospital, Limerick, closed during the year, the centre is referred to as Tearmann and Curragour Wards in this report. The original date of admission for long-term patients transferred from St Loman's Hospital, Mullingar, to Cluain Lir Care Centre, Mullingar, was preserved to maintain their length of stay in the in-patient services.

In 2012, there were six additional beds in the Department of Psychiatry, Midland Regional Hospital, Portlaoise, to accommodate patients from Lakeview Unit, Naas General Hospital. As this report is activity-based, admissions for these patients from Lakeview Unit are included in figures for the Midland Regional Hospital, Portlaoise.

In 2012, admissions to the Cluain Mhuire Service include admissions where private health insurance was invoked. In previous years these admissions were not included as admissions to Cluain Mhuire but were included as private admissions to St John of God Hospital (at year end in the NPIRS annual Activities report). Thus, an increase in admissions to Cluain Mhuire will be noticed in comparison with previous years.

Differences in data reported for child and adolescent admissions should be noted between the MHC's annual inspectorate report (Mental Health Commission 2013) and data in this report. Admissions for children and adolescents in this report include all admissions for persons under 18 years of age, regardless of their marital status, whereas the MHC's data on admissions for children and adolescents include admissions for children as defined under the Mental Health Act 2001, i.e. a child is defined as a person under the age of 18 years other than a person who is or has been married.

Data for the NPIRS were returned quarterly to the MHIS Unit of the HRB, either electronically or manually, according to agreed specifications. With the manual system, completed forms were returned to personnel at the HRB in accordance with procedures and practices established over a number of years. Personnel at the HRB code and process the data and maintain on-going liaison with hospital personnel. The admission and discharge form used to collect data from hospitals is presented in Appendix 1.

## **Quality assurance and validation of data**

Data received from units and hospitals for the NPIRS are subjected to various in-built and manual quality assurance and validation measures, according to policies and procedures employed by the MHIS. Data are cleaned and validated upon receipt and import of data into the database, prior to the return of quarterly status reports to units and hospitals, prior to the return of annual status reports, and at year end in preparation for this report. All units and hospitals are required to sign off on final admission and discharge data for the year in advance of the preparation of this report.

## **Legal status**

The legal status recorded by NPIRS is that recorded on admission, and while changes may occur in legal status following admission, this is not recorded by the NPIRS. It is important to note that data on legal status presented in this report differs from that reported by the MHC (Mental Health Commission 2012) for a number of reasons. Data contained here do not include data on Form 13 – Admission Order to Detain a Voluntary Patient (Adult) – whereas MHC figures do. This is the re-grading of the legal status of a voluntary patient to involuntary.

## **Transfers**

NPIRS does not record information on transfers because under Sections 20 and 21 of the Mental Health Act 2001, transfers of detained patients either to another approved centre or to the Central Mental Hospital (CMH) remain patients of the centre from which they are transferred. Transfers to the CMH (the only centre so far designated for the reception of such transfers) from the courts and prisons are regulated by the Criminal Law Insanity Act 2006. Patients detained in approved centres can be transferred to the CMH but only following authorisation by a mental health tribunal as provided for by the Mental Health Act 2001.

## Computation of rates

The rates accompanying numerical data in this report were calculated using the Census of Population 2011 (Central Statistics Office 2012). All data were rated to the total population. In previous years, rates were calculated per 100,000 population aged 16 years and over and also per 100,000 population aged 15 years and over. However, in more recent years, it was decided to revert to using total population as the denominator as this is the standard used internationally and it thus allows comparative analysis.

Population figures for 2011 for HSE areas by socio-economic group could not be used to calculate rates because the population figures for socio-economic groups were not available by HSE areas as the census data produced by the CSO for socio-economic groups by electoral divisions (EDs) related to the socio-economic group of the reference person/household rather than every person resident in the state on census night. Thus, it was not possible to calculate the socio-economic group for the total population for each HSE area.

## Health Service Executive Areas

The composition of HSE areas and the Mental Health Catchment Areas (MHCAs)/Local Health Offices (LHOs) (with which MHCAs are generally coterminous) that comprise HSE areas, consist of EDs. Population figures using the 2011 census of population for the HSE areas have been calculated using previously agreed EDs for each area. As mentioned above, population figures for socio-economic groups were not available by HSE area because these data by EDs related to the socio-economic group of the reference person/household rather than every person resident in the state on census night.

All LHOs were requested to confirm their agreement with the updated population figures and, although confirmation for some areas remained outstanding at the time of production of this report, the figures were used as they were based on previously agreed configurations.

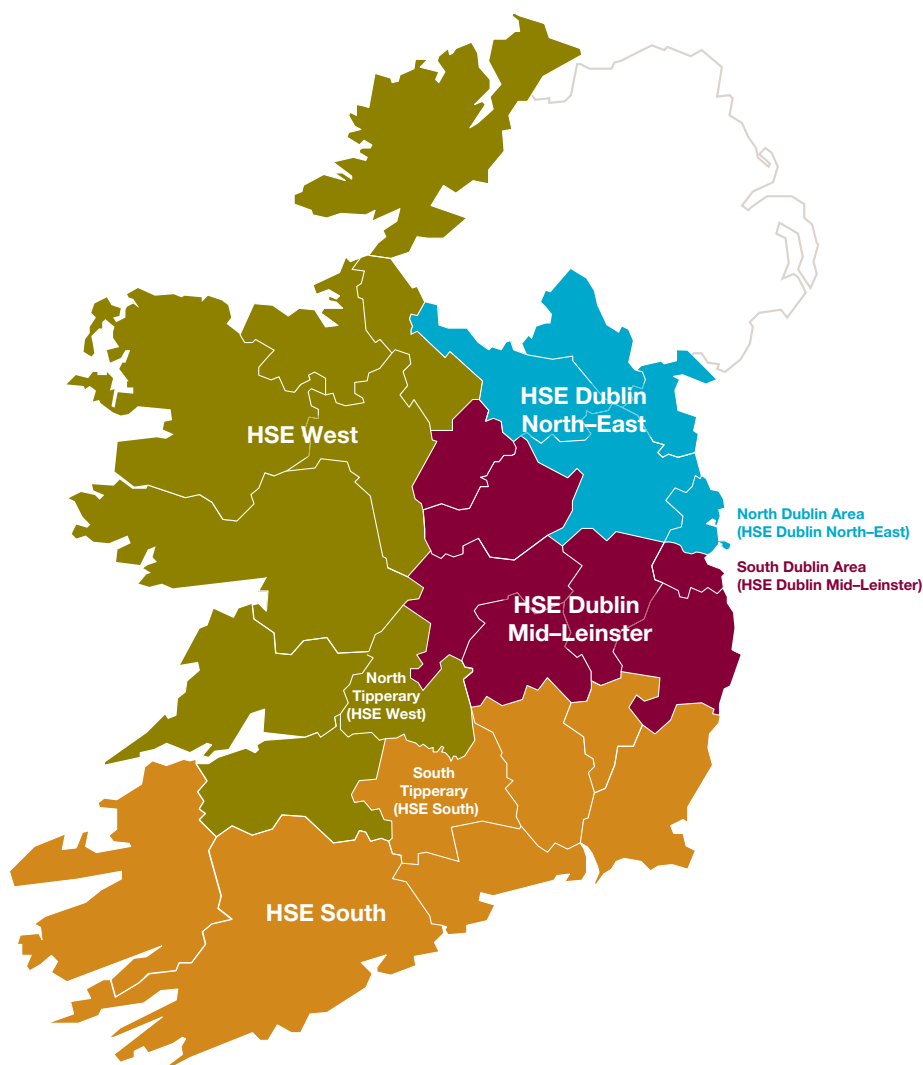

In this report, the address from which a person was admitted was used to assign them to a HSE area. Thus, HSE area refers to the HSE area of residence of the person. In contrast, HSE area, as reported by the MHC, is determined by the location of the approved centre to which a person was admitted, i.e. HSE area of hospitalisation. Thus, data on involuntary admissions by HSE areas presented in this report differ from those reported by the Mental Health Commission due to differences in assigning persons to a HSE area.

Population figures based on CSO census data for 2011 for each HSE area are presented below in Table 1.3. The four HSE areas are roughly equal in terms of the total population.

**Table 1.3** Health Service Executive Areas population

Hospital type	Males	Females	Total
Dublin Mid-Leinster	664,578	686,977	1,351,555
Dublin North-East	502,376	516,159	1,018,535
South	563,939	569,919	1,133,858
West	541,806	542,498	1,084,304
<b>Total</b>	<b>2,272,699</b>	<b>2,315,553</b>	<b>4,588,252</b>

**Figure 1.1** Health Service Executive Areas 2012

**HSE Dublin Mid-Leinster – Total Population: 1,351,555.** Includes Cluain Mhuire Mental Health Catchment Area 1 (South County Dublin), Mental Health Catchment Area 2 (Dublin South-East), Mental Health Catchment Area 3 (Dublin South), Mental Health Catchment Areas 4 and 5 (Dublin South and South-West), Mental Health Catchment Area 9 (Kildare and West Wicklow), Mental Health Catchment Area 10 (East Wicklow), Laois/Offaly Mental Health Catchment Area, Longford/Westmeath Catchment Area.

**HSE Dublin North-East – Total Population: 1,018,535.** Includes Mental Health Catchment Area 6 (Dublin North-West), Mental Health Catchment Area 7 (Dublin North), Mental Health Catchment Area 8 (North County Dublin), Louth/Meath Mental Health Catchment Area, Cavan/Monaghan Mental Health Catchment Area.

**HSE South – Total Population: 1,133,858.** Includes North Lee Mental Health Catchment Area, South Lee Mental Health Catchment Area, North Cork Mental Health Catchment Area, West Cork Mental Health Catchment Area, Kerry Mental Health Catchment Area, Waterford/Wexford Mental Health Catchment Area, Carlow/Kilkenny/South Tipperary Mental Health Catchment Area.

**HSE West – Total Population: 1,084,304.** Includes East Galway Mental Health Catchment Area, West Galway Mental Health Catchment Area, Mayo Mental Health Catchment Area, Roscommon Mental Health Catchment Area, Sligo/Leitrim Mental Health Catchment Area, Donegal Mental Health Catchment Area, Limerick Mental Health Catchment Area, Clare Mental Health Catchment Area.

## Diagnosis

The diagnostic groups in this report are based on the WHO International Classification of Diseases categories (ICD-10, WHO 1992) and are presented in Table 1.4. From 2004, the ICD-10 diagnostic codes were assembled by us into new, more appropriate groupings. Therefore, some groups are not entirely comparable with diagnostic categories used prior to the 2004 report. Only three of the new categories are directly comparable to the old categories: alcoholic disorders, other drug disorders and intellectual disability.

Eating disorders, developmental disorders, and behavioural, emotional disorders of childhood and adolescence are presented as individual entities, whereas previously these three categories were included in the neuroses and personality disorder groupings. However, it should be pointed out that organic, schizophrenic, depressive and manic conditions arising in childhood and adolescence are included in the 'F' codes appropriate to these disorders and are not presented as disorders of childhood and adolescence. Finally, ICD-10 uses the term 'mental retardation', but our grouping is of 'intellectual disability' to accord with current Irish usage.

**Table 1.4** ICD-10 diagnostic groups

ICD-10 diagnostic group	ICD-10 code
1 Organic disorders	F00–09
2 Alcoholic disorders	F10
3 Other drug disorders	F11–19, F55
4 Schizophrenia, schizotypal and delusional disorders	F20–F29
5 Depressive disorders	F31.3, F31.4, F31.5, F32, F33, F34.1, F34.8, F34.9
6 Mania	F30, F31.0, F31.1, F31.2, F31.6, F31.7, F31.8, F31.9, F34.0
7 Neuroses	F40–48
8 Eating disorders	F50
9 Personality and behavioural disorders	F60–69
10 Intellectual disability	F70–79
11 Development disorders	F80–89
12 Behavioural, emotional disorders of childhood and adolescence	F90–98
13 Other and unspecified disorders	F38, F39, F51–54, F59, F99

## Limitations

While every effort is made to ensure that data are of the highest quality and while the MHIS Unit engages with the mental health services and engages in continuous quality assurance activities relating to the database, a number of limitations to the data should be noted.

Any change in admissions or discharges over time or any comparisons with previous or subsequent years must be interpreted with caution and must take into account additional facilities submitting data in any given year and/or approved centres closing in any given year. In 2012, three additional in-patient facilities became approved centres under the Mental Health Act 2001 and submitted data to the NPIRS in 2012. Three centres were removed from the Register of Approved Centres, while Curragour Ward in St Camillus' Hospital, Limerick, was also removed. In addition, as mentioned earlier, data presented by the MHC and that presented here may differ due to reasons already outlined and, thus, comparisons between both sets of data must be interpreted with caution.

Comparison of rates over time should also be interpreted with caution given the change in the population base used to calculate rates over the years. From 2006, it was decided to revert to using the total population for the calculation of rates as this is the standard used internationally, allowing for comparability of rates across countries. For this reason, Table 2.2 presents rates of all and first admissions for 1965–2012 per 100,000 total population, allowing comparability of Irish rates over time.

Population rates for public catchment areas are calculated on the basis of total populations and, accordingly, include privately insured persons who are more likely to use private services. Since the proportion of privately medically insured persons differs between catchment areas, rates will be inflated in some catchments with a high proportion of such persons who do not depend on public services. As, for the moment, we are unable to adjust for this inflation of denominator catchment populations, comparison of rates between catchments should be done with caution.

As some services do not provide a preliminary diagnosis on admission, but rather supply diagnoses on discharge, diagnostic data on admissions not discharged by the end of the year during which they have been admitted are not available for those services. In these instances, a number of admissions have been returned with unspecified diagnoses and, therefore, the 'Other and unspecified' diagnostic category includes those with an unspecified mental disorder (F99) and those for whom no diagnosis had been assigned at the time of submission of data to the MHIS Unit. A number of hospitals also indicated

having difficulty obtaining diagnoses for admissions/discharges from medical personnel and this is also reflected in the number of admissions/discharges returned with unspecified diagnoses. It is particularly disappointing that some hospitals continue to report this problem despite on-going requests and the increasing emphasis on evidence-based information to inform service planning and delivery. This will inevitably affect the rates reported for diagnosis and, in particular, tables relating to individual units and hospitals and their respective catchment areas.

The collection of information relating to socio-economic group continues to pose a major problem for many units and hospitals. In 2012, 46% of occupations were returned as unknown, rendering assignment to a socio-economic group impossible. This should be borne in mind when interpreting tables and figures relating to socio-economic group.

The issue of recording data on patients who are transferred between units and hospitals has been a continuing problem for many hospitals. The difficulties have been accentuated by the increasing number of catchment areas where general hospital psychiatric units operate and the psychiatric hospital remains open in the same catchment and transfers occur between the two. This is in addition to transfers from one catchment area to another and of the small number of transfers to the CMH. This issue was addressed at a training seminar, during which the HRB policy concerning how transfers should be dealt with was outlined, and it was further emphasised during recent visits to units and hospitals. Transfers to general hospitals for medical, surgical or other treatment are not required for HRB reporting purposes as this would lead to the loss of valuable length-of-stay information given that, while in the general hospital, patients, unless discharged, on legal grounds remain 'on the books' of the transferring hospital.

Section 14(2) of the Mental Health Act 2001 requires a patient/person presenting with an application and recommendation for involuntary admission to be examined by a consultant psychiatrist within 24 hours. At this examination, some may be deemed not to have a mental illness or a mental illness not warranting admission; some may be admitted voluntarily even though in most cases the consultant completes the admission order and the patient is admitted involuntarily. Although patients may be allowed home following examination, such patients may have been recorded as having been admitted, albeit for a short period of time, i.e. less than 24 hours. Such persons may be reflected in the admission figures in this report, although it is likely that the numbers are small. From 2009, the MHIS Unit has requested that persons should only be returned as admitted when the admission order is made or they have been admitted voluntarily; those allowed home following examination by a consultant within 24 hours should not be recorded as an admission.

Admissions and discharges represent episodes or events rather than persons. Thus, one person may have several admissions during the course of a year and each admission is recorded separately. Admissions do not necessarily represent incidence of mental illness but rather the activity of in-patient services. Throughout the country there may be considerable differences in admission rates from service to service, but this does not necessarily indicate variations in incidence and may simply reflect differing admission practices.

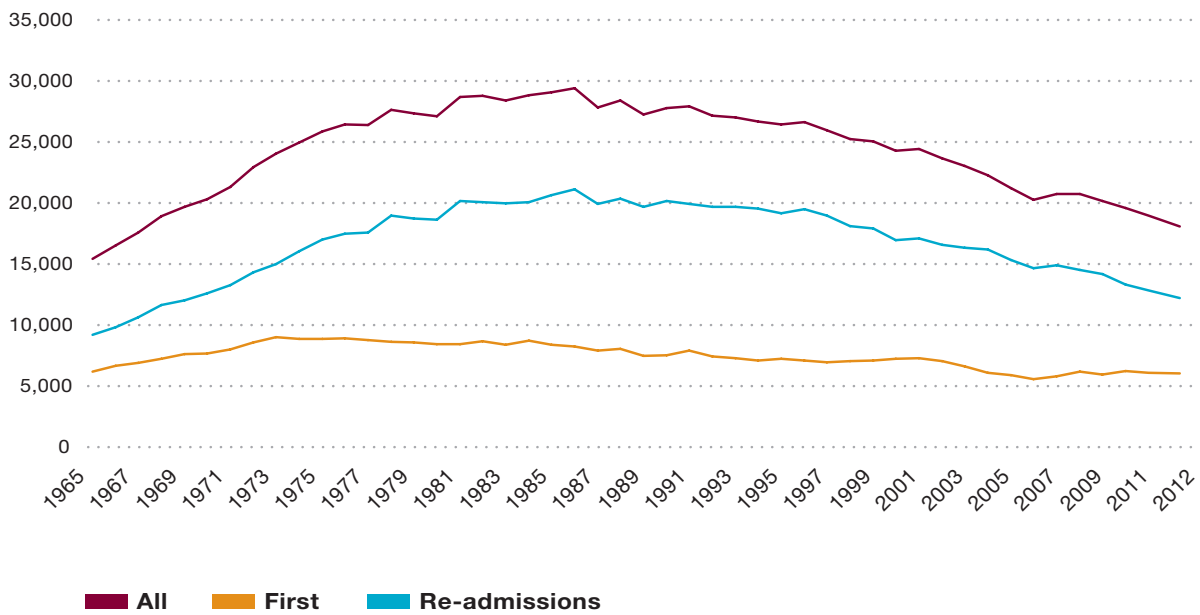

## 2 National and Regional (HSE) Admissions, Discharges and Deaths

### National all and first admissions

There were 18,173 admissions to Irish psychiatric units and hospitals in 2012, a rate of 396.1 per 100,000 total population (Table 2.1 and Table 2.2). This is a reduction of 819 admissions from 2011 and a decline in rates from 413.9 in 2011 to 396.1 in 2012. The number of first admissions remained unchanged from 2011, at 6,130 (6,129 in 2011). Thus, the rate of first admissions remained unchanged, at 133.6 per 100,000. Re-admissions declined by 820, from 12,863 in 2011 to 12,043 in 2012, while the proportion of admissions that were re-admissions also declined from 68% in 2011 to 66% in 2012.

Approved centres reported an additional eleven persons presenting for admission in 2012 but these were not subsequently admitted but were referred/returned home.

Admission numbers have been declining since reaching a peak of 29,392 in 1986 (Figure 2.1 and Table 2.1). There has been a 21% decline in admissions in the ten-year period from 2003–2012, from 23,031 in 2003 to 18,173 in 2012. Re-admissions have shown a greater level of decline during this period, at 26.5%, from 16,375 in 2003 to 12,043 in 2012. While the overall number of first admissions has not changed greatly over the last 40 years or so, there has been an 8% decline from 2003–2012, from 6,656 in 2003 to 6,130 in 2012.

**Figure 2.1** All, first and re-admissions. Ireland 1965-2012. Numbers

## Gender and age

There was an equal proportion of male and female admissions; however, males had a slightly higher rate of all admissions, at 401.0 per 100,000, compared with 391.2 for females (Table 2.3). Similarly, males had a higher rate of first admissions, at 142.6 per 100,000, compared with 124.7 for females.

As in 2011, the 45–54 year age group had the highest rate of all admissions, at 612.7 per 100,000, followed by the 55–64 year age group, at 562.3, and the 35–44 year age group, at 547.7 (Table 2.3). Although the 18–19 year age group had the lowest rate of all admissions, they had the highest rate of first admissions, at 233.5, followed by the 20–24 year age group, at 221.0, and the 45–54 year age group, at 181.0.

## Marital status

Single persons accounted for over half (55%) of all admissions, married persons accounted for 27%, widowed accounted for 4% and divorced accounted for 4%. While accounting for just 4% of all admissions, divorced persons had the highest rate of all admissions, at 749.7 per 100,000, followed by single persons, at 403.3, and widowed persons, at 390.5 (Table 2.4). The rate of admissions for married persons was lowest, at 284.6 per 100,000. Divorced persons had the highest rate of first admissions, at 189.1, followed by widowed persons, at 148.6, and single persons, at 126.1. Married persons had the lowest rate of first admissions, at 111.1 per 100,000.

Single and widowed males had higher rates of all admissions (435.2 and 471.2, respectively) than their single and widowed female counterparts (369.1 and 366.9) (Table 2.4). Females who were married or divorced had higher rates of all admissions, at 324.9 and 801.0 per 100,000, respectively, than males who were married (244.4) or divorced (682.7). The pattern for first admissions was similar, with single and widowed males having higher rates of admissions than their female counterparts, and married or divorced females having higher rates of first admissions than their male counterparts.

### **Socio-economic group**

As in previous years, the unskilled occupational group had the highest rate of all (856.2) and first admissions (219.2) (Table 2.5); however, it is worth noting that 46% of occupations were returned as unknown or unspecified, making assignment to a socio-economic group impossible. Agricultural workers had the second-highest rate of all admissions, at 399.9, followed by semi-skilled workers, at 337.5, and manual skilled, at 310.8. Employers and managers had the lowest rate of all admissions, at 64.5. The semi-skilled group had the second-highest rate of first admissions, at 108.4, followed by the manual skilled group, at 104.2, and the non-manual group, at 98.0. As with all admissions, employers and managers had the lowest rate of first admissions, at 26.4.

### **Principal economic status**

Forty per cent of all admissions in 2012 were returned as unemployed, 25% as employed, 11% as retired, 7% as students, 7% as engaged in house duties, while 10% were returned as unknown.

### **Ethnicity**

Eighty-four per cent of all admissions in 2012 were returned as 'White Irish', 5.3% were returned as 'Any Other White Background' and 2.9% were distributed amongst various other ethnic groups. Eight per cent were returned as 'Unknown/unspecified'.

### **Primary admission diagnosis**

As in previous years, depressive disorders were the most common diagnoses recorded for admissions, accounting for 30% of all, 32% of first and 28% of re-admissions, and accounting for the highest rate of all (117.4) and first (43.2) admissions (Tables 2.6a and 2.6b). Schizophrenia accounted for 20.5% of all, 13% of first and 24.5% of re-admissions and had the second-highest rate of all admissions, at 81.1 per 100,000. Schizophrenia also had the second-highest rate of first admissions, along with neuroses, with rates of 16.8 per 100,000 each. Mania accounted for 11.5% of all, 8% of first and 13% of re-admissions and had the third-highest rate of all admissions, at 45.7. Alcohol accounted for 7.5% of all, 8.5% of first and 7% of re-admissions.

Eighty per cent of all admissions for personality and behavioural disorders were re-admissions, 79% of all admissions for schizophrenia and 77% of all admissions for mania were re-admissions (Table 2.6b).

Females had higher rates of all admissions for depressive disorders, at 127.3 per 100,000, compared with 107.3 for males (Table 2.6a). Males had a marginally higher rate of first admissions for depressive disorders, at 43.6, compared with 42.8 for females. Males had higher rates of all and first admissions for schizophrenia than females, with rates of 95.7 for all and 19.5 for first, compared with 66.7 and 14.2 for all and first admissions for females.

## **Legal status**

Eleven per cent (10.6%) of all and 11% (10.9%) of first admissions were involuntary, a slight increase from almost 10% (9.5%) of all and almost 11% (10.5%) of first admissions in 2011 (Table 2.7a). There was a slight increase in the rate of involuntary all admissions from 39.4 per 100,000 in 2011 to 41.9 in 2012 (Table 2.7b). The rate for first admissions remained relatively unchanged, at 14.5 per 100,000 (14.0 in 2011). Admissions for schizophrenia had the highest rate of involuntary all admissions, at 18.0, followed by mania, at 8.1, and depressive disorders, at 4.9 (Table 2.8).

It should be noted that data on legal status differ from that reported by the Mental Health Commission. Data in this report do not include data on admission orders to detain voluntary patients, whereas data reported by the Mental Health Commission include such admission orders.

## **No fixed abode**

There were 174 admissions with no fixed abode in 2012. Seventy-one per cent of these were male, 76% were single, 28% had a diagnosis of schizophrenia, 18% had a diagnosis of other drug disorders and 14% had a diagnosis of depressive disorders.

## **National discharges and deaths**

There were 17,986 discharges from, and 153 deaths in, Irish psychiatric units and hospitals in 2012 (Table 2.9). Males accounted for 60% of all deaths in 2012, and 82% of those who died were aged 65 years and over (Table 2.10).

Ninety-two per cent of all those admitted in 2012 and 93% of first admissions in 2012 were discharged in 2012.

## Length of stay

Almost one-third (30.3%) of all discharges took place within one week of admission, 18% occurred within one to two weeks of admission, 20% occurred within two to four weeks of admission and a further 26% occurred within one to three months of admission (Table 2.11). Overall, ninety-four per cent were discharged within three months of admission.

Forty per cent of discharges with a primary discharge diagnosis of alcoholic disorders, 29% with a diagnosis of depressive disorders and 20% with a diagnosis of schizophrenia occurred within one week of admission (Table 2.11). Over 90% of discharges for most disorders occurred within three months of admissions, with the exception of organic mental disorders (73%), schizophrenia (88%), intellectual disability (77%) and development disorders (88%).

Thirty-two per cent of discharges in 2012 who were admitted voluntarily occurred within one week of admission, compared with 16% of those who were admitted involuntarily (Table 2.12). Seventy per cent of patients discharged in 2012 and who were admitted voluntarily were discharged within four weeks of admission, compared with 52% of those admitted involuntarily.

## In-patient days

Table 2.13a presents analysis of in-patient days for all discharges, including deaths, and Table 2.13b presents a similar analysis for lengths of stay up to one year. In Table 2.13b, 1.8% of all discharges (327 discharges out of 18,139 discharges) were excluded, as they distort the number of bed days considerably due to the small number of discharges with considerably long lengths of stay. This is evident by the difference in the average length of stay in both tables: 92.4 was the average length of stay for all discharges, whereas the average length of stay for discharges up to one year was 25.5. The median length of stay in both analyses was 14 days.

Discharges with a diagnosis of organic mental disorders had the longest average length of stay, at 51.9 days (median 26 days), and accounted for 2.5% of discharges and 5% of in-patient days (Table 2.14b). Eating disorders had the second-highest average length of stay, at 35.7 days (median 24 days), accounting for just 1% of discharges and almost 2% of in-patient days. Schizophrenia had the third-highest average length of stay, at 35.0 days (median 19 days), and accounted for 21% of discharges and 28% of in-patient days. Other drug disorders had the shortest average length of stay, at 13.0 days (median 6 days).

## Health Service Executive (HSE) Areas

### All and first admissions

Twenty-eight per cent of all admissions were resident in Dublin Mid-Leinster in 2012, 22% were resident in Dublin North-East, 25% were resident in HSE South and almost 25% (24.5%) were resident in HSE West. Less than one per cent were returned as non-resident on admission.

All admission rates were highest amongst those resident in HSE West, at 411.3 per 100,000, followed by HSE South, at 407.9, and Dublin North-East, at 387.2. Dublin Mid-Leinster had the lowest rate of all admissions, at 376.6 per 100,000 (Table 2.15). First admissions were highest amongst those resident in HSE South, at 141.9 per 100,000, followed by Dublin North-East, at 140.5, and HSE West, at 125.7. Admissions for those resident in Dublin Mid-Leinster had the lowest rate of first admissions, at 125.3.

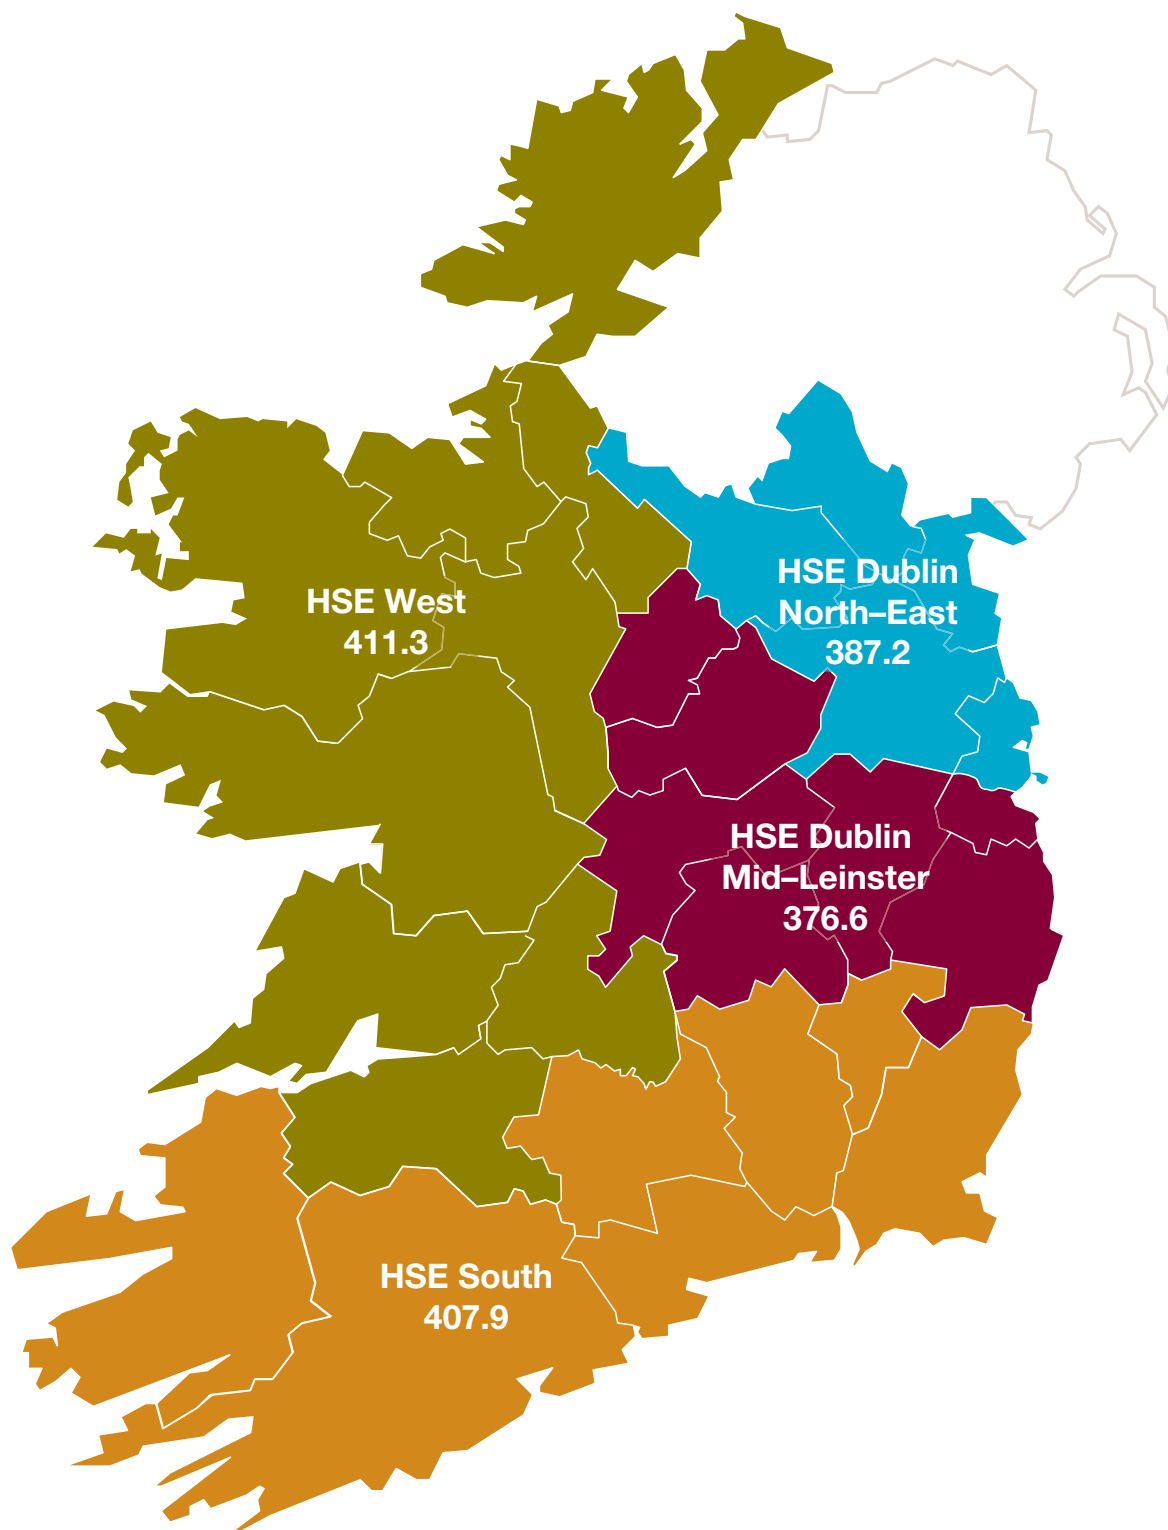

The proportion of re-admissions ranged from 69% for admissions resident in HSE West to 64% for admissions resident in Dublin North-East (Table 2.15). HSE West had the highest rate of re-admissions, at 285.6 per 100,000, followed by HSE South, at 266.0, Dublin Mid-Leinster, at 251.3, and Dublin North-East, at 246.7.

### Gender and age

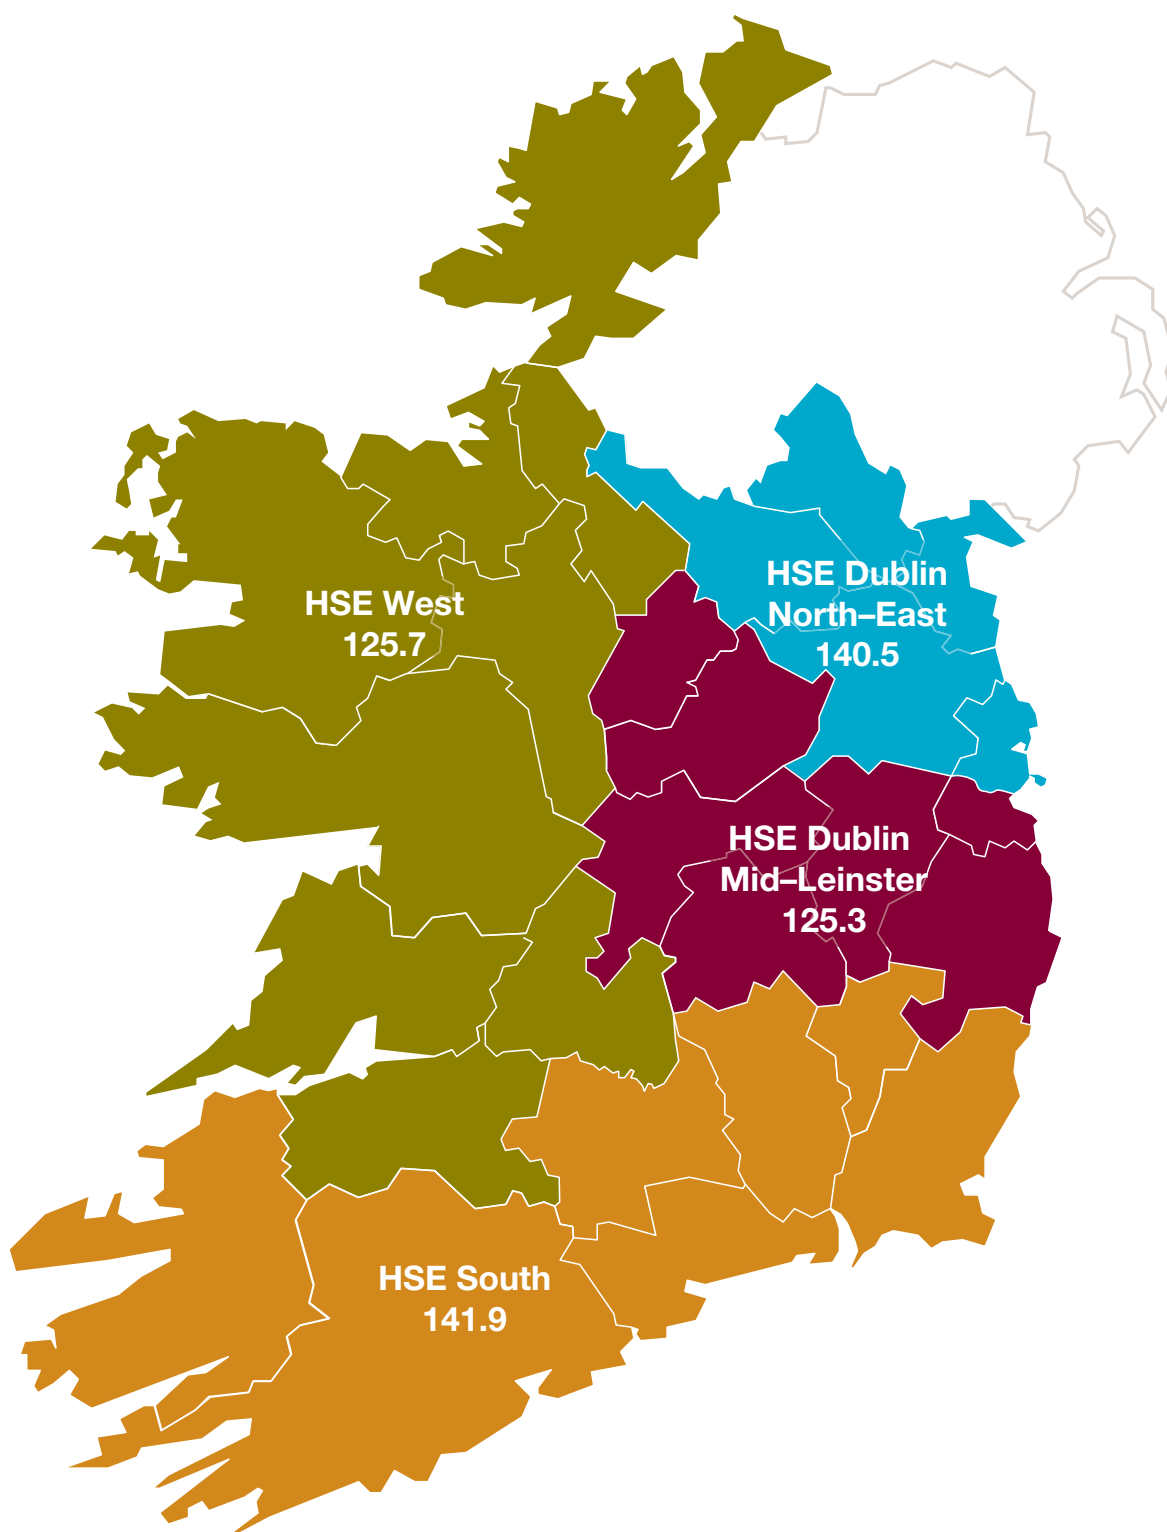

Females had higher rates of all admissions in Dublin Mid-Leinster, at 382.1, and Dublin North-East, at 397.9, compared with 370.9 for males in Dublin Mid-Leinster and 376.2 in Dublin North-East. In contrast, males had higher rates in HSE South and West, at 413.9 and 443.3 respectively, compared with 402.0 for females in HSE South and 379.4 in HSE West. Males had higher rates of first admissions in all HSE areas, with rates ranging from 151.1 in HSE Dublin North-East to 130.3 in Dublin Mid-Leinster.

All admission rates for the 45–54 year age group were highest amongst three of the four HSE areas: Dublin Mid-Leinster, at 612.4 per 100,000, Dublin North-East, at 617.5, and HSE South, at 619.0 (Table 2.16). The 20–24 year age group had the highest rate of admission amongst those resident in HSE West. The pattern for first admissions was somewhat different, with the 75 year and over age group having the highest rates amongst those in Dublin Mid-Leinster, at 207.9 per 100,000, followed closely by the 18–19 year age group, at 207.8 (Table 2.17). The 20–24 year age group had the highest rates amongst those in HSE South, at 270.4, and HSE West, at 253.9, while the 18–19 year age group had the highest rates amongst those in Dublin North-East, at 262.6.

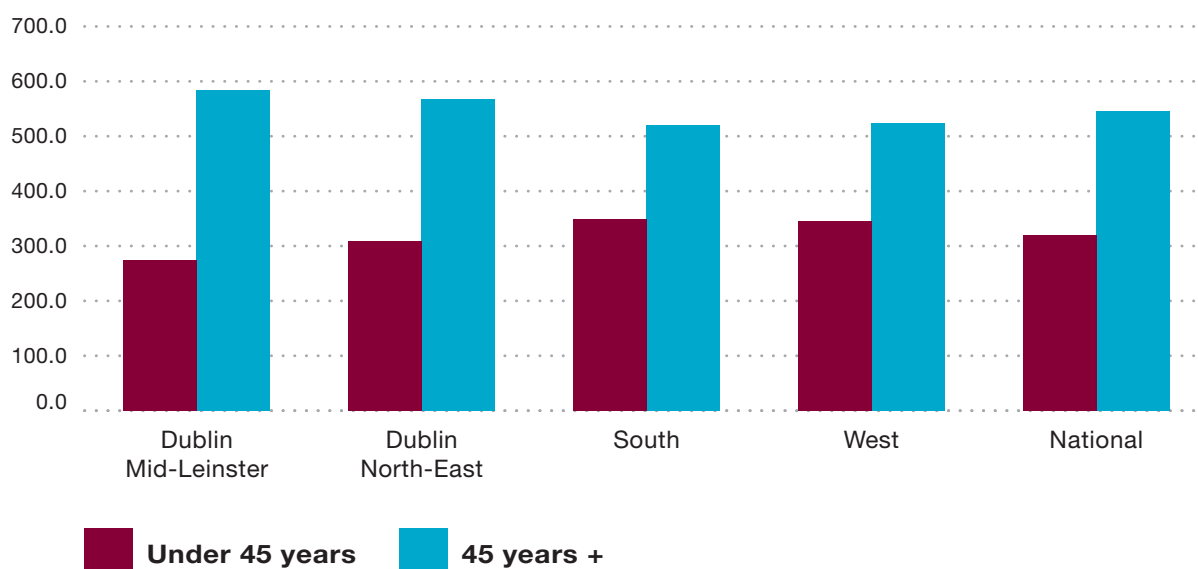

**Figure 2.2** Health Service Executive Areas. All admissions. Ireland 2012.  
Rates per 100,000 total population

**Figure 2.3** Health Service Executive Areas. First admissions. Ireland 2012.  
Rates per 100,000 total population

Age groups were condensed into two distinct groups, under 45 years and 45 years and over. The 45 years and over group had the highest rate of admissions in all HSE areas, with rates ranging from 581.6 in Dublin Mid-Leinster to 516.3 in HSE South (Figure 2.4).

**Figure 2.4** Health Service Executive Areas. All admissions by age category.  
Ireland 2012. Rates per 100,000 total population

## Marital status

Divorced persons had the highest rate of admissions in each of the four HSE areas, with rates ranging from 980.2 per 100,000 in Dublin North-East to 645.7 in HSE South (Table 2.18). A similar trend was observed for first admissions, with rates ranging from 251.3 in Dublin North-East to 141.9 in Dublin Mid-Leinster. Married persons had the lowest rate of all admissions in all areas, with rates ranging from 303.8 per 100,000 in Dublin Mid-Leinster to 256.9 in HSE West. Similarly, rates for first admissions in all HSE areas were lowest for married persons, with rates ranging from 121.6 in HSE South to 103.2 in HSE West.

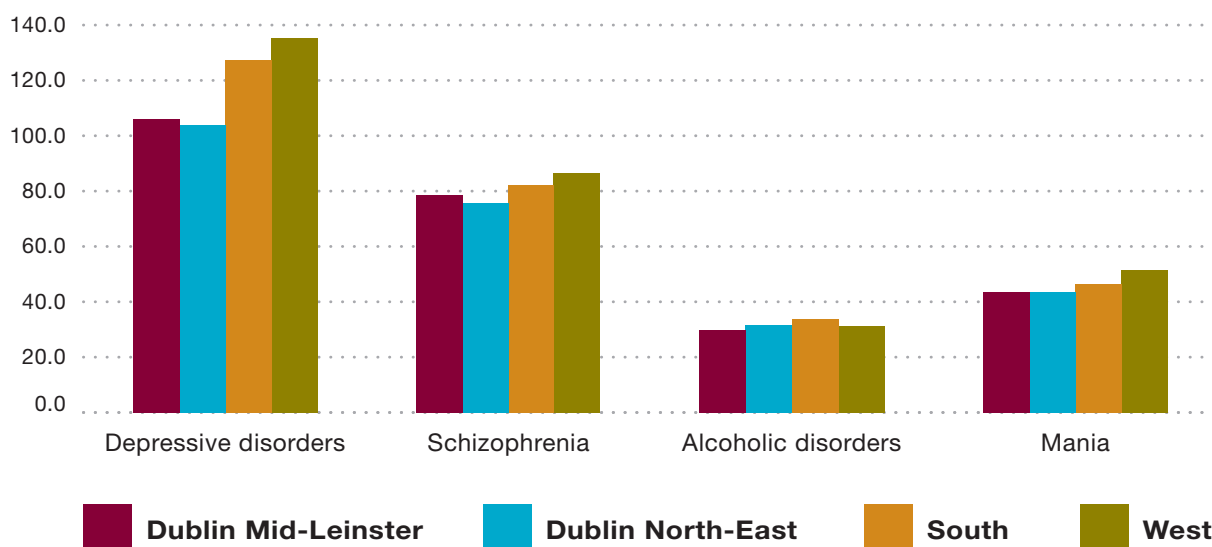

## Socio-economic group<sup>1</sup>

Non-manual occupations accounted for the highest proportion of all and first admissions, with all admissions ranging from 17% in Dublin Mid-Leinster to 13% in Dublin North-East, and first admissions ranging from 17% in Dublin Mid-Leinster to 11% in Dublin North-East (Table 2.19 and Table 2.20). However, data regarding socio-economic group should be interpreted with caution as 46% of occupations were returned as unknown or unspecified, making assignment to a socio-economic group impossible.

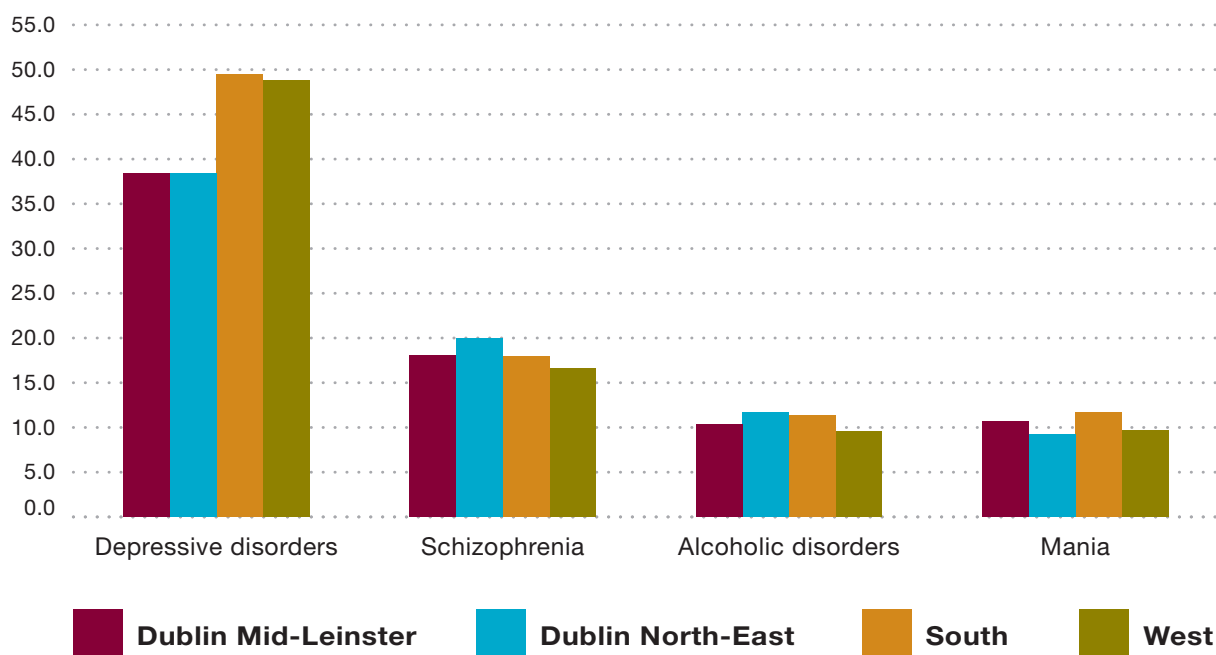

<sup>1</sup> Rates for socio-economic group by HSE areas could not be calculated for 2012 as the breakdown by persons was not produced in the Small Area Population Statistics for 2011. The data produced for EDs related to the socio-economic group of the reference person and household rather than every person resident in the state on census night. Thus, it was not possible to calculate the socio-economic group for the total population for each HSE area.

## Primary admission diagnosis

Depressive disorders had the highest rate of all and first admissions across all four HSE areas in 2012. Rates for all admissions ranged from 132.9 per 100,000 in HSE West to 103.9 in Dublin North-East (Table 2.21 and Figure 2.5). Rates for first admissions ranged from 49.3 per 100,000 in HSE South to 37.7 in Dublin Mid-Leinster (Table 2.22 and Figure 2.6). Schizophrenia had the second-highest rate of all admissions, with rates ranging from 86.9 in HSE West to 75.7 in Dublin North-East, while rates for mania, the third-highest amongst all HSE areas, ranged from 51.2 in HSE West to 41.7 in Dublin North-East (Table 2.21 and Figure 2.5).

**Figure 2.5** Health Service Executive Areas. All admissions by selected diagnoses.  
Ireland 2012. Rates per 100,000 total population

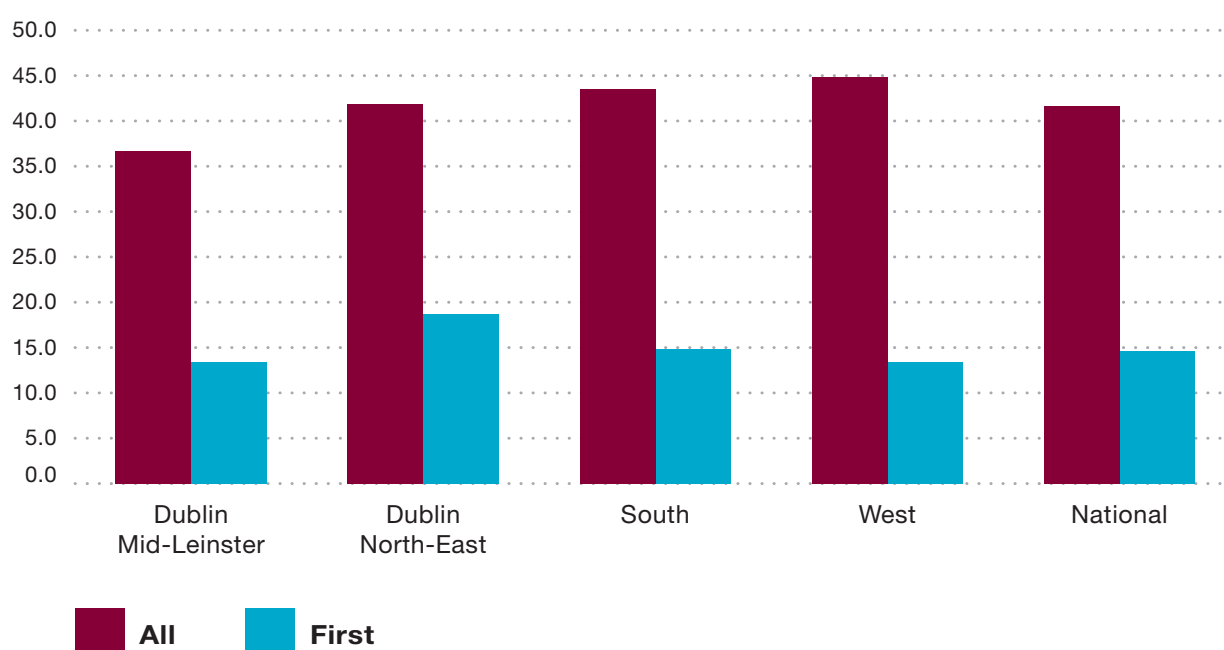

**Figure 2.6** Health Service Executive Areas. First admissions by selected diagnoses.  
Ireland 2012. Rates per 100,000 total population

## Legal status

Eleven per cent of all admissions resident in HSE West and 11% resident in Dublin North-East were involuntary, while 10% in HSE South and 10% in Dublin Mid-Leinster were involuntary. Thirteen per cent of first admissions in Dublin North-East were involuntary, compared with 10% in each of the three remaining HSE areas.

HSE West had the highest rate of involuntary all admissions, at 44.9 per 100,000, followed by HSE South, at 42.8, Dublin North-East, at 42.3, and Dublin Mid-Leinster, at 36.8. Dublin North-East had the highest rate of involuntary first admissions, at 17.8 per 100,000, followed by HSE South, at 14.7, Dublin Mid-Leinster, at 12.6, and HSE West, at 12.5 (Figure 2.7 and Table 2.23).

**Figure 2.7** Health Service Executive Areas. All and first involuntary admissions. Ireland 2012.  
Rates per 100,000 total population

## Length of stay

Almost one-third of all discharges in three of the four HSE areas in 2012 occurred within one week of admission (Table 2.24): 31.5% in Dublin North-East, 31% in HSE South and 31% in HSE West. Twenty-eight per cent of discharges for Dublin Mid-Leinster occurred within one week of admission. Seventy-two per cent of discharges for HSE West, 69% for HSE South, 68% for Dublin North-East and 64% for Dublin Mid-Leinster occurred within four weeks of admission, while over 92% in all areas occurred within three months of admission.

Average length of stay was longest for HSE South, at 131.4 days (median 14 days), when all discharges were examined, followed by Dublin North-East, at 107.6 days (median 13 days), and HSE West, at 81.1 days (median 13 days) (Table 2.26a). Average length of stay was shortest for Dublin Mid-Leinster, at 54.9 days (median 16 days). When discharges of one year or more were excluded to adjust for the distortion of in-patient days caused by the small number of discharges with considerably long lengths of stay, average length of stay was longest for Dublin Mid-Leinster, at 27.5 days (median 16 days), followed by Dublin North-East, at 25.8 days (median 13 days), and HSE South, at 25.2 days (median 13 days) (Table 2.26b). Length of stay was shortest in HSE West, at 23.1 days (median 13 days).

## Counties

Table 2.27a and Table 2.27b, along with Figure 2.8 and Figure 2.9, present rates of all and first admissions by county of residence. Admissions returned as non-residents (54) were excluded from this analysis. In 2012, rates of all admissions were highest for counties Sligo (544.4), Roscommon (541.6), Kerry (528.5) and Tipperary South (490.8) (Table 2.27a and Figure 2.8). Monaghan had the lowest rate of all admissions, at 157.1, followed by Cavan, at 214.5 per 100,000. Roscommon had the highest rates reported for first admissions, at 187.3, followed by Kerry, at 175.3, Wexford, at 167.2, and Carlow, at 153.8. Monaghan had the lowest rates of first admissions, at 44.6, followed by Offaly, at 84.8.

## Primary admission diagnosis

All admissions resident in Mayo had the highest rate for depressive disorders, at 227.3 per 100,000, followed by Tipperary South, at 179.8, Sligo, at 165.2, and Wicklow, at 148.6. Monaghan had the lowest rate of all admissions for depressive disorders, at 41.3 per 100,000.

Kerry had the highest rate of all admissions for schizophrenia, at 129.2 per 100,000, followed by Leitrim, at 116.4, Sligo, at 116.2, and Roscommon, at 106.1. Carlow had the lowest rate of all admissions for schizophrenia, at 36.6 per 100,000.

Admissions from Sligo had the highest rate of all admissions for alcoholic disorders, at 47.4 per 100,000, followed by Leitrim, at 47.2, Kerry, at 46.7, and Donegal, at 44.1. Offaly had the lowest rate of all admissions for alcoholic disorders, at 6.5 per 100,000.

Mayo had the highest rate of first admissions for depressive disorders, at 91.1 per 100,000, followed by Laois, at 62.1, Wicklow, at 60.0, and Kerry, at 55.7. Monaghan had the lowest rate of first admissions for depressive disorders, at 9.9 per 100,000.

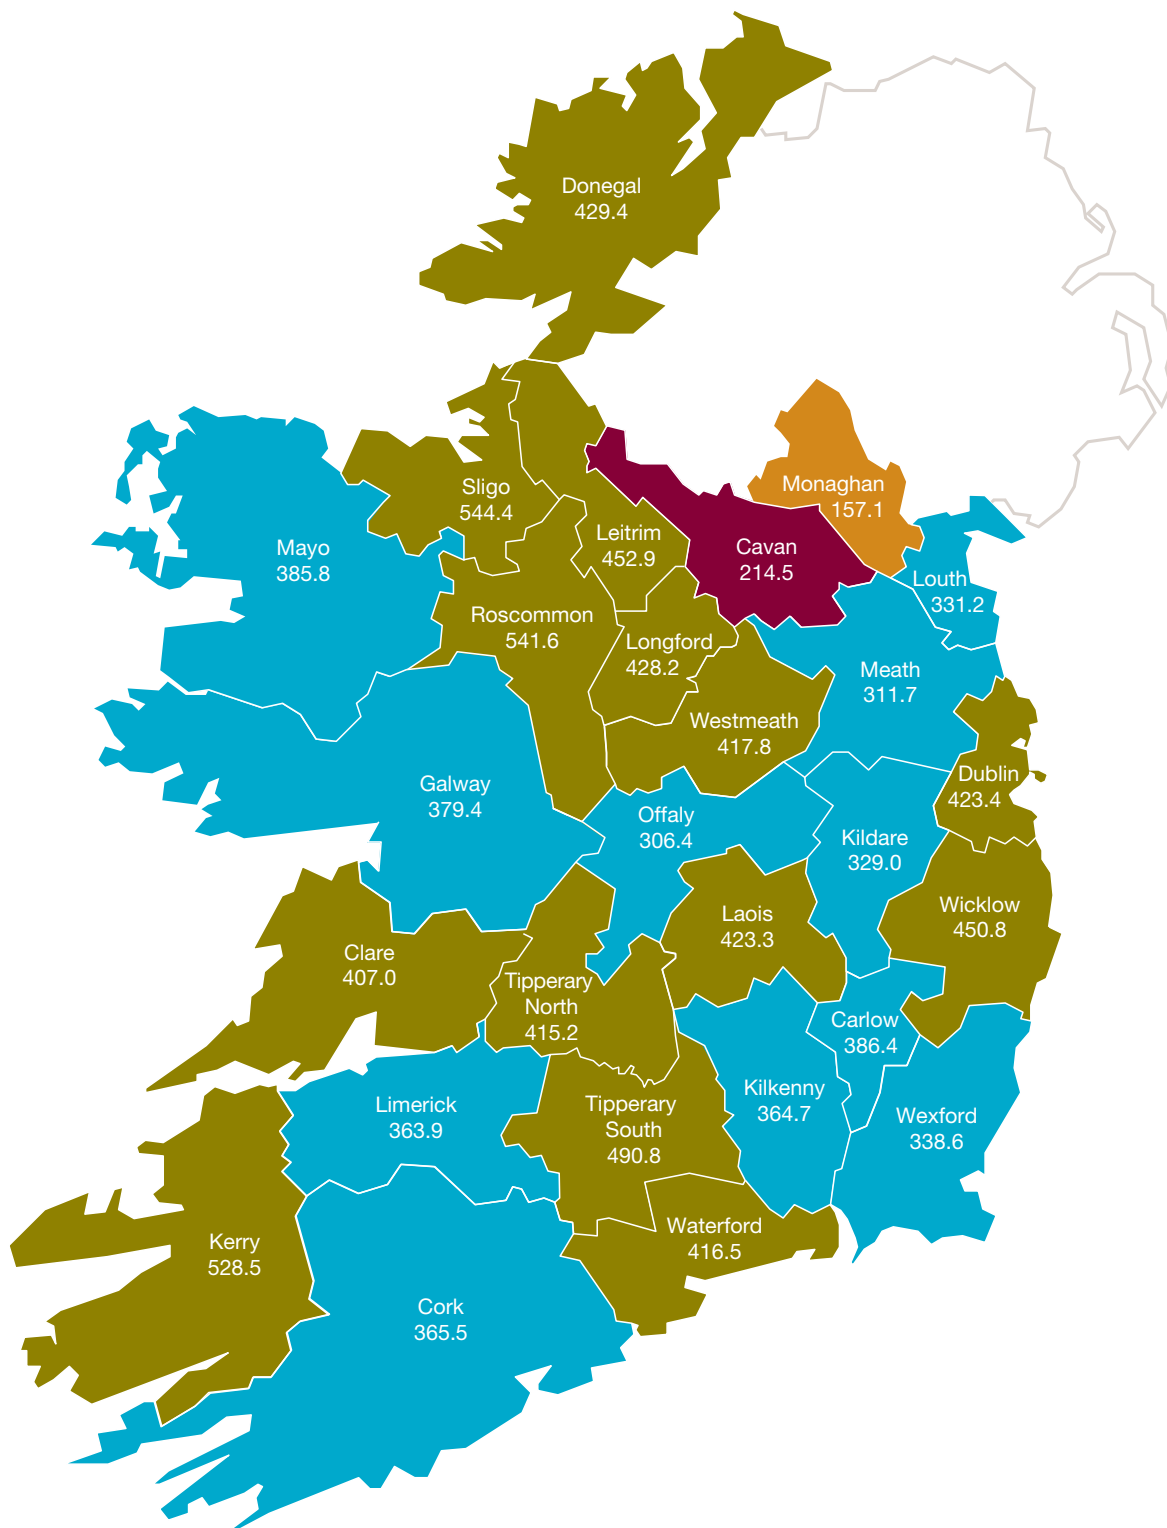

First admissions from Kerry had the highest rate of first admissions for schizophrenia, at 24.7 per 100,000, followed by Dublin, at 21.3, Donegal, at 20.5, and Kildare, at 20.4. Kilkenny had the lowest rate of first admissions for schizophrenia, at 5.2 per 100,000.

Kerry had the highest rate of first admissions for alcoholic disorders, at 18.6 per 100,000, followed by Sligo, at 18.4, Westmeath, at 17.4, and Donegal, at 17.4. Clare had the lowest rate of first admissions for alcoholic disorders, at 3.4 per 100,000.

## **Non-residents**

The designation of persons as non-resident is determined by the address given by them at the time of their admission and it is therefore more likely to reflect persons who have recently arrived in the country.

There were 54 admissions for non-residents in 2012, an increase of five such admissions from 2011. Thirty-nine per cent of admissions for non-residents had an address originating in Northern Ireland, 24% had an address originating in England, 13% in the USA, 7% in Germany and 4% in Denmark, with the remaining distributed amongst various other countries (Table 2.28). Almost 32% (31.5%) of non-residents had a primary diagnosis of schizophrenia, 26% had a diagnosis of mania, 11% had a diagnosis of personality and behavioural disorders and 9% had a diagnosis of depressive disorders (Table 2.29).

### 3 Hospital Type – Admissions, Discharges and Deaths

Almost 57% (56.5%) of all admissions in 2012 were to general hospital psychiatric units, 22% were to psychiatric hospitals (including the Central Mental Hospital Dundrum; Carraig Mór, Cork; and St Joseph's Intellectual Disability Services, St Ita's Hospital, Portrane) and a further 22% were to independent/private and private charitable centres (Table 3.1 and Figure 3.1). There was an increase of two percentage points in admissions to general hospital psychiatric units from 2011–2012 and a corresponding decrease in admissions to psychiatric hospitals from 2011–2012. The proportion of admissions to independent/private and private charitable centres remained the same from 2011 to 2012. In the ten-year period from 2003–2012, admissions to general hospital psychiatric units increased from 44% in 2003 to almost 57% in 2012, admissions to psychiatric hospitals have decreased from 38% in 2003 to 22% in 2012, with admissions to independent/private and private charitable centres increasing from 18% in 2003 to 22% in 2012.

Re-admissions accounted for 70% of all admissions to psychiatric hospitals, 66% of all admissions to general hospital psychiatric units and almost 63% (62.5%) of all admissions to independent/private and private charitable centres.

**Figure 3.1** Hospital type. All admissions. Ireland 2012. Percentages

#### Gender and age

In 2012, males accounted for over half of all and first admissions to general hospital psychiatric units (53% of all and 56% of first) and psychiatric hospitals (54% of all and 57% of first), while females accounted for almost 61% (60.5%) of all and 58% of first admissions to independent/private and private charitable centres (Table 3.1).

In keeping with the pattern of previous years, the age profile of admissions to independent/private and private charitable centres was older than that of general hospital psychiatric units or psychiatric hospitals. Almost 61% (60.5%) of admissions to independent/private and private charitable centres were over 45 years of age, compared with 43% to general hospital psychiatric units and 46% to psychiatric hospitals (Table 3.2). Over half of all admissions to general hospital psychiatric units (57%) and 54% of all admissions to psychiatric hospitals were under 45 years of age, compared with almost 40% (39.5%) of admissions to independent/private and private charitable centres.

## Marital status

A higher proportion of all admissions to general hospital psychiatric units (61%) and psychiatric hospitals (54.5%) were single, compared with admissions to private hospitals (40%) (Table 3.3). In contrast, married persons accounted for a higher proportion of admissions to independent/private and private charitable centres, at 44.5%, compared with 22% to general hospital psychiatric units and 22% to psychiatric hospitals.

## Socio-economic group

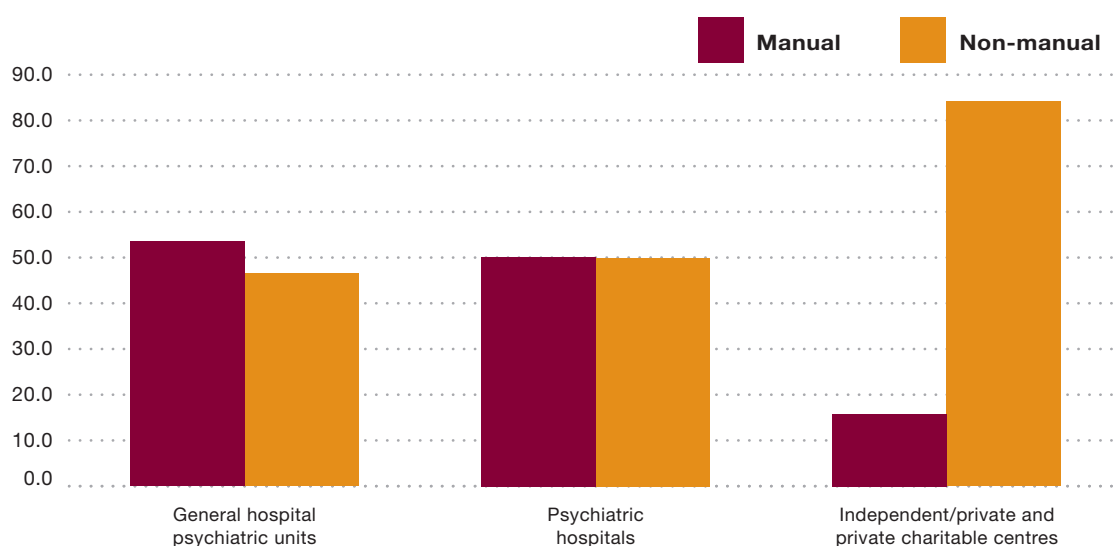

Twenty-eight per cent (27.6%) of all admissions to independent/private and private charitable centres were for higher and lower professionals (combined), compared with 8% (7.6%) to general hospital psychiatric units and 5.5% to psychiatric hospitals (Table 3.4), in keeping with the pattern observed over many years. Nineteen per cent of all admissions to independent/private and private charitable centres were for non-manual occupations, compared with 15% to general hospital psychiatric units and 11% to psychiatric hospitals.

Socio-economic groups were categorised into two distinct groups, manual and non-manual occupations<sup>2</sup> and there were clear differentials in admissions to the different types of hospitals for the two groups. Eighty-six per cent of admissions to independent/private and private charitable centres were for non-manual occupations, compared with 51% to psychiatric hospitals and 49% to general hospital psychiatric units (Figure 3.2).

---

<sup>2</sup> Manual occupations include agricultural workers, manual skilled, semi-skilled and unskilled. Non-manual occupations include higher professional, lower professional, employers and managers, own account workers and non-manual workers. Farmers and unspecified occupations have been excluded from this classification.

**Figure 3.2** Hospital type. All admissions by manual and non-manual occupations.  
Ireland 2012. Percentages

## Primary admission diagnosis

Over one-third of all (36%) and first (35%) admissions to independent/private and private charitable centres had a primary admission diagnosis of depressive disorders (Table 3.6 and Table 3.7). The comparable figures for general hospital psychiatric units were 29.5% of all and 32% of first, while those for psychiatric hospitals were 23.5% of all and 29% of first admissions.

Schizophrenia accounted for a much lower proportion of all (8%) and first (4%) admissions to independent/private and private charitable centres, compared with 23% of all and 14% of first admissions to general hospital psychiatric units and 27% of all and 19% of first admissions to psychiatric hospitals (Table 3.6 and Table 3.7). A higher proportion of all (12%) and first (12%) admissions to independent/private and private charitable centres were for alcoholic disorders, compared with 6.5% of all and 7.5% of first admissions to general hospital psychiatric units and 5.5% of all and 6% of first admissions to psychiatric hospitals.

## Legal status

Sixteen per cent of all admissions to psychiatric hospitals and 12% of all admissions to general hospital psychiatric units were involuntary, compared with just 2% of all admissions to independent/private and private charitable centres (Table 3.8). This is an increase in the proportion of involuntary admissions to both psychiatric hospitals (13% in 2011) and general hospital psychiatric units (11%) from 2011 to 2012. The pattern was similar for first admissions, with involuntary admissions accounting for 19% of first admissions to psychiatric hospitals, 12% of admissions to general hospital psychiatric units and just 2% of first admissions to independent/private and private charitable centres.

## Length of stay

Over one-third of all discharges from both general hospital psychiatric units (36%) and psychiatric hospitals (34%) occurred within one week of admission, compared with 11% from independent/private and private charitable centres (Table 3.9). Over half of all discharges from general hospital psychiatric units (56%) and from psychiatric hospitals (54%) occurred within two weeks of admission, compared with 23% from independent/private and private charitable centres.

Average length of stay for all discharges was longest in psychiatric hospitals, at 309.2 days (median 12 days), followed by 47.2 days (median 31 days) in independent/private and private charitable centres and 24.2 days (median 11 days) in general hospital psychiatric units (Table 3.10a). When discharges of one year or more were excluded, independent/private and private charitable centres had the longest average length of stay, at 36.3 days (median 31 days), followed by psychiatric hospitals, at 25.6 days (median 11 days) and general hospital psychiatric units, at 21.3 days (median 11 days) (Table 3.10b).

<sup>a</sup> Discharges with a length of stay of one year or more were excluded from the analysis. Almost two per cent of discharges were thus excluded.

## 4 Individual Units and Hospitals – Admissions, Discharges and Deaths

This chapter presents data on individual units and hospitals, along with data on mental health catchment areas (MHCA) and their respective rates. The catchment area breakdowns and the various electoral divisions that comprise each area were previously supplied courtesy of Health Atlas, Health Promotion Unit in the HSE, and these areas were updated using the CSO census of population for 2011. Their populations were confirmed with Local Health Offices (LHO). However, the verification of the composition of some catchment areas still remains outstanding due to uncertainty regarding boundaries. Notwithstanding this, the numbers concerned are small and are not likely to change the rates significantly. A list of the individual units and hospitals by each catchment area is presented in Appendix 2.

The addition of new centres and also the closure of centres will naturally affect patterns in the rates for catchment areas over time and this should be borne in mind if comparing rates for such catchment areas over a particular time period. Particular changes in the composition of catchment areas should be noted for 2012. Whereas previously St Senan's Hospital, Enniscorthy, was presented for the Wexford area, it is now included in the extended Waterford/Wexford catchment area. Similarly, South Tipperary catchment area is now included in the area Carlow/Kilkenny/South Tipperary, with units and hospitals previously located in Clonmel becoming part of this new extended area.

As noted earlier in the report, in 2012, admissions to the Cluain Mhuire Service includes admissions where private health insurance was invoked. In previous years, these admissions were not included as admissions to Cluain Mhuire but were included as private admissions to St John of God Hospital (at year end in the NPIRS annual Activities report). Thus, an increase in admissions to Cluain Mhuire will be noticed in comparison with previous years.

Changes noted earlier include the closure of Hampstead and Highfield Hospitals and the registration of Highfield Hospital. Patients from St Loman's Hospital, Mullingar, were transferred to the new approved centre, Cluain Lir Care Centre; however, their original date of admission was preserved to maintain their length of stay in the in-patient services.

In 2012, there were six additional beds in the Department of Psychiatry, Midland Regional Hospital, Portlaoise, to accommodate patients from Lakeview Unit, Naas General Hospital. As this report is activity-based, admissions for these patients from Lakeview Unit are included in figures for the Midland Regional Hospital, Portlaoise.

Changes or items of note regarding individual units and hospitals are noted with footnotes in Table 4.2 and these have not been repeated for every table in this chapter. All tables referred to in this chapter are presented at the end of the chapter.

All and first admissions for individual catchment areas and their respective populations are presented in Table 4.1. All admission rates for catchment areas ranged from 498.5 per 100,000 in Roscommon to 160.9 in Cavan/Monaghan. First admission rates ranged from 176.5 in Dublin North-West (MHCA 6) to 18.5 in Cluain Mhuire catchment area (MHCA 1).

The number of admissions to individual units and hospitals for 2011 and 2012, along with the difference and percentage change from 2011 to 2012 are presented in Table 4.2. There was a reduction in admissions to all types of hospital from 2011 to 2012. Admissions to general hospital psychiatric units fell by 85, from 10,362 in 2011 to 10,277 in 2012. Admissions to psychiatric hospitals decreased by 501, from 4,436 in 2011 to 3,935 in 2012; and admissions to independent/private and private charitable centres decreased by 233, from 4,194 in 2011 to 3,961 in 2012.

## **Primary admission diagnosis by catchment area**

All and first admission rates for each catchment area by primary admission diagnosis are presented in Table 4.3 and Table 4.4. Mayo MHCA had the highest rate of all admissions for depressive disorders, at 221.2 per 100,000, followed by North Lee MHCA, at 151.3, and Sligo/Leitrim MHCA, at 126.3 (Table 4.3). Cluain Mhuire had the lowest rate of all admissions for depressive disorders, at 21.8 per 100,000.

Kerry MHCA had the highest rate of all admissions for schizophrenia, at 126.5 per 100,000, followed by West Galway, at 123.3, and Roscommon, at 112.5 (Table 4.3). North Cork MHCA had the lowest rate of all admissions for schizophrenia, at 24.6 per 100,000.

Kerry MHCA had the highest rate of all admissions for alcoholic disorders, at 44.7 per 100,000, followed by North Lee, at 41.8, and Donegal, at 41.5 (Table 4.3). North County Dublin (MHCA 8) had the lowest rate of all admissions for alcoholic disorders, at 0.8 per 100,000.

As for all admissions, Mayo MHCA had the highest rate of first admissions for depressive disorders, at 92.6 per 100,000, followed by North Lee MHCA, at 58.3, and East Wicklow, at 46.3 (Table 4.4). Cluain Mhuire had the lowest rate of first admissions for depressive disorders, at 3.8 per 100,000.

Dublin North-West (MHCA 6) had the highest rate of first admissions for schizophrenia, at 31.0 per 100,000, followed by Dublin North (MHCA 7), at 28.8, and Dublin South (MHCA 3), at 28.1 (Table 4.4). Mayo MHCA had the lowest rate of first admissions for schizophrenia, at 3.8 per 100,000.

West Cork MHCA had the highest rate of first admissions for alcoholic disorders, at 21.2, followed by Kerry MHCA, at 17.9, and Dublin North-West (MHCA 6), at 17.2 (Table 4.4). North County Dublin (MHCA 8) had the lowest rate of first admissions for alcoholic disorders, at 0.8 per 100,000.

## **Length of stay**

As noted in previous years, length of stay on discharge varied greatly across hospitals. In two hospitals, St Brigid's Hospital, Ardee, and St Vincent's Hospital, Fairview, just over 50% of all discharges occurred within one week of admission (Table 4.21). Other hospitals reported over 40% of all discharges occurring within one week of admission: Tallaght Hospital (45.9%), Our Lady's Hospital, Navan (42.9%), St Luke's Hospital, Kilkenny (44.8%), South Tipperary General Hospital (43.2%), Bantry General Hospital (41.2%), Naas General Hospital (40.4%), Newcastle Hospital, Greystones (46.5%) (Table 4.20 and Table 4.21). In contrast, the proportion of discharges from independent/private and private charitable centres within one week of admission was very small, the highest proportion being 12.7% of discharges from St Edmundsbury Hospital (Table 4.22).

Table 4.23, Table 4.24 and Table 4.25 present average length of stay for individual units and hospitals for all discharges. Discharges from St James's Hospital, Dublin, had the longest average length of stay for general hospital psychiatric units, at 39.9 days (median 12 days), followed by St Vincent's University Hospital, Elm Park, Dublin, at 35.3 days (median 20 days), and the Mercy Hospital, Cork, at 28.9 days (median 12 days) (Table 4.23). Discharges from University College Hospital, Galway, had the shortest average length of stay, at 17.9 days (median 9 days).

Average length of stay for psychiatric hospitals was considerably longer due to the history of longer lengths of stay in some of the older psychiatric hospitals. Some averages were in excess of 5,000 days; however, the number of discharges in these cases was very small and thus skewed the averages (Table 4.24). Bloomfield Hospital had the longest average length of stay amongst the independent/private and private charitable centres, at 806.4 days (median 466.5 days), followed by Highfield Hospital, at 380.8 days (median 35 days) (Table 4.25). St Edmundsbury Hospital had the shortest average length of stay amongst the independent/private and private charitable centres, at 33.6 days (median 29 days).

<sup>a</sup> Includes admissions to beds allocated for patients from Lakeview Unit, Naas General Hospital.

<sup>b</sup> Includes transfers to and from St Otteran's Hospital, Waterford.

<sup>c</sup> Acute psychiatric unit closed in July 2012 and patients from South Tipperary will henceforth be admitted to St Luke's Hospital, Kilkenny.

<sup>d</sup> Removed from the Register of Approved Centres 2011.

<sup>e</sup> New approved centre on the Register of Approved Centres in 2012.

<sup>f</sup> Includes transfers to and from the Department of Psychiatry, Waterford Regional Hospital.

<sup>g</sup> Removed from Register of Approved Centres 2012.

<sup>h</sup> These two admissions were necessary as both patients were in-patients of St Joseph's Psychiatric Hospital for a number of years and discharged to a community residence. However, due to challenging behaviour, they were required to be admitted to undergo intensive recovery work.

<sup>i</sup> The 2012 data for Lois Bridges, Sutton, are provisional and subject to change.

## 5 Child and Adolescent Admissions

This chapter presents data on admissions for persons under 18 years of age to adult and dedicated child and adolescent services, regardless of the in-patient facility to which they were admitted. Thus, some admissions may have been reported on earlier in the report. However, data on admissions to dedicated child and adolescent units have not been reported on previously. These centres are Warrenstown House/Linn Dara Child and Adolescent Inpatient Unit, Dublin; Ginesa Unit, St John of God Hospital, Dublin; St Anne's Children's Centre, Galway/CAMHS Galway; St Joseph's Adolescent In-patient Unit, St Vincent's Hospital, Fairview; Éist Linn Child and Adolescent In-patient Unit, Cork; and Willow Grove Adolescent Unit, St Patrick's Hospital, Dublin.

### All and first admissions

There were 397 admissions for under 18s in 2012 (Table 5.1). This is a decline in admissions of 38 since 2012 (435<sup>3</sup>). There were 299 first admissions for under 18s, accounting for 75% of all admissions. There were 288 admissions to dedicated child and adolescent services (Table 5.2) and 75% (215) of these were first admissions. There were 109 admissions for under 18s to adult psychiatric hospitals.

### Gender and age

Females accounted for 60% of all and 61% of first admissions for under 18s (Table 5.1). Almost 38% of all admissions for under 18s were aged 17 years on admission, 25% were aged 16 years, 19% were aged 15 years, 9% were aged 14 years, 6% were aged 13 years and 2.5% were aged 12 years or younger (Table 5.1).

Females accounted for 64% of all and 65% of first admissions to dedicated child and adolescent units (Table 5.2). Twenty-eight per cent of all admissions to child and adolescent units were aged 17 years on admission, 23% were aged 16 years, 25% were aged 15 years, 12% were aged 14 years, 9% were aged 13 years and 3.5% were aged 12 years or younger on admission.

Of the 109 admissions to adult psychiatric units and hospitals, 69 were aged 17 years, 33 were aged 16 years, five were aged 15 years and two were aged 14 years.

---

<sup>3</sup> There were three persons aged 18–19 admitted to dedicated child and adolescent services in 2011 and, as they availed of such services, they were thus included in the data for child and adolescents for 2011.

## Primary admission diagnosis

Thirty-five per cent of all admissions for under 18s had a primary admission diagnosis of depressive disorders, 13% had a diagnosis of neuroses, 12% had a diagnosis of schizophrenia and 10% had a diagnosis of eating disorders (Table 5.3). Females accounted for almost 71% (70.5%) of all admissions for under 18s with a primary diagnosis of depressive disorders, 52% of all admissions for mania and 85% of all admissions for eating disorders. In contrast, males accounted for 57% of all admissions for under 18s with a primary admission diagnosis of schizophrenia and 58% of all admissions for neuroses.

Thirty-four per cent of first admissions for under 18s had a primary admission diagnosis of depressive disorders, 13% had a diagnosis of neuroses, 12% had a diagnosis of eating disorders and 10% had a diagnosis of schizophrenia (Table 5.3). Females accounted for 68% of first admissions for under 18s with a primary diagnosis of depressive disorders, 83% of first admissions with eating disorders and 57% of admissions with schizophrenia. Males accounted for 60% of first admissions with neuroses and 56% of first admissions with mania.

## Legal status

Almost 5% (4.5%) of all admissions for under 18s were involuntary in 2012 and 4% of first admissions were involuntary (Table 5.4). This is equivalent to 18 involuntary all admissions and 12 involuntary first admissions. Twenty-eight per cent of all involuntary admissions for under 18s had a primary diagnosis of depressive disorders, 22% had a diagnosis of schizophrenia and 17% each had a diagnosis of mania and other drug disorders (Table 5.5).

## Hospital type

Almost 73% (72.5%) of all admissions for under 18s were to dedicated child and adolescent units, 21% were to general hospital psychiatric units, 6% were to psychiatric hospitals and there were no admissions to independent/private and private charitable centres (Table 5.6). Almost identical proportions were observed for first admissions.

## Length of stay

Eighty-five per cent of under 18s admitted in 2012 were discharged in 2012. Of those admitted and discharged in 2012, 28% were discharged within one week, 11% were discharged within one to two weeks, 15% were discharged within two to four weeks, 36% were discharged within one to three months and 10% were discharged within three months to one year of admission (Table 5.7)

The average length of stay for under 18s admitted and discharged in 2012 was 38 days (median 22 days) (Table 5.8). The average length of stay for those admitted and discharged in 2012 was longest for child and adolescent units, at 52.1 days (median 42 days), followed by psychiatric hospitals, at 11.5 days (median 6.5 days), and general hospital psychiatric units, at 7 days (median 4 days).

## National Psychiatric In-Patient Reporting System (NPIRS) Admission and Discharge Form

### NATIONAL PSYCHIATRIC IN-PATIENT REPORTING SYSTEM PART 1: ADMISSION

#### Area from which patient was admitted

Area of Patient's home, hospital or hostel at which patient was residing at the time of admission to hospital. If the patient is resident in Dublin please give postal district where applicable.

1. Address line 1

2. Address line 2

3. County of Residence

4. Hospital Name/Unit Name

5. Hospital Reference Number  6. Patient Reference Number

7. Date of Present Admission  8. Date of Birth

9. Gender ☐ 10. Marital Status ☐ 11. Legal Category ☐ 12. Order of Admission ☐

MALE 1	SINGLE 1	VOLUNTARY 1	FIRST EVER 1
FEMALE 2	MARRIED 2	NON VOLUNTARY 2	OTHER 2
	WIDOWED 3		
	DIVORCED 4		
	OTHER 5		
	UNKNOWN 6		

13. Ethnicity

White <input type="checkbox"/>	Black <input type="checkbox"/>	Asian <input type="checkbox"/>	Other, including mixed race <input type="checkbox"/>
IRISH 1	AFRICAN 5	CHINESE 7	OTHER 9 Please specify: <input type="text"/>
IRISH TRAVELLER 2	OTHER BLACK 6	OTHER ASIAN 8	
ROMA 3	BACKGROUND	BACKGROUND	
OTHER WHITE 4			
BACKGROUND			

14. Country of Birth

15. Occupation

A. Occupation of Patient   
If patient is unemployed or retired please indicate previous occupation

B. Is the PATIENT presently ☐ Employed 1 Student 4  
Unemployed 2 House duties 5  
Retired 3 Unknown 6

C. If PATIENT is a student or engaged in home duties or never worked please state occupation of head of household/principal earner.

D. Employment Status of Holder of Occupation A or C ☐

Employer 1	Employee 3
Self employed without paid employees 2	Assisting Relative 4

(not receiving a fixed wage or salary)

16. DIAGNOSES

ICD 10 CODE	ICD 10 CODE
Diagnosis 1 F <input type="text"/> <input type="text"/> . <input type="text"/> <input type="text"/>	Diagnosis 2 F <input type="text"/> <input type="text"/> . <input type="text"/> <input type="text"/>

### PART 2: DISCHARGE

17. Reason for Discharge Discharge 1 ☐  
Death 2 ☐

18. Date of Discharge

19. Diagnosis if different from admission

ICD 10 CODE	ICD 10 CODE
Diagnosis 1 F <input type="text"/> <input type="text"/> . <input type="text"/> <input type="text"/>	Diagnosis 2 F <input type="text"/> <input type="text"/> . <input type="text"/> <input type="text"/>
